System Type: Upgrade
Freight Terms: FOB Destination
Warranty Terms: Part numbers beginning with two (2) asterisks (**) are covered by a ninety (90) day product warranty. All other part numbers are third (3rd) party items.
Special Notations: Contingencies must be removed 120 days before scheduled shipment to assure delivery on specified date. Any rigging costs are the responsibility of the Purchaser.
Additional Terms:

Line #	Part #	Description	Qty
1	**NCVB878	**Interventional Tools Hardware**	1

The Interventional hardware is the hardware for the 3D interventional tools and enables import and viewing of DICOM compatible data from other imaging modalities.

The Interventional Hardware comprises at least:
- Computer Workstation
- CR 19" display
- 16 GB memory
- 2 TB disk for the operating system, application software and application data
- Internal CD-Rom / DVD writer
- Mouse tablet to interact with all the interventional tools at the table side.

Conditionally:
FD Calibration Tool Kit for 3D-RA

Line #	Part #	Description	Qty
2	**NCVA567	**StentBoost sw Rel. 2.0**	1

StentBoost is a unique interventional tool to improve visualization of stents in the coronary arteries during interventions. This, Philips exclusive, innovative interventional tool produces a highly augmented image of a deployed stent in coronary arteries - while the catheter is still in place. The StentBoost image helps clinicians to make a thorough check of stent expansion, and stent position of stents in relation to other objects, like other stents, without the use of extra contrast or other 'expensive' consumables. This allows interventional cardiologists to immediately take any corrective action required while your patient is still in the examination room.
The way it works
StentBoost automatically detects the stent delivery markers image after image. In each image StentBoost aligns the markers with the markers of the previous image. By doing this all radiopaque material in the close proximity of the markers will be enhanced and items further away from the markers will be less visible.
The result provides enhanced contrast of the environment surrounding the markers, including the stent, while background noise is reduced.
StentBoost Workflow

1. Image acquisition
StentBoost is based on a maximum of 40 frames out of a cine run. Depending on the frames speed this takes the user 2-3 seconds.

2. Image transfer
The run will automatically be transferred to the interventional workstation and show up in the StentBoost software.
The Real time link (NCVA590) is a unique option within the Allura Xper FD10 R.2 and Allura Xper FD10/10 and allows instant access to the StentBoost image.

FOR INFORMATION PURPOSES ONLY
THIS IS A SUMMARY SHEET NOT A QUOTE

3. Region of Interest definition
The StentBoost software shows the acquired run with a predefined Region of interest. With the

region of interest user has to indicate where the markers of the stent delivery markers are located in the image run.

4. StentBoost
After definition of the region of interest, the user presses next and within seconds, the boosted image shows up on the screen.
A real time operation user interface is available with StentBoost, providing:

- Review of StentBoost runs, before and after processing
- Viewing tools like Brightness/Contrast, Pan and Zoom to optimize the image displayed
- Automatic stent delivery system marker identification
- Reliability feedback regarding the enhanced run
- Manual quality improvement; Manual correction possibility for marker identification
- View patient info like, Birth date, Gender, Patient ID, Exam ID, Exam date, Run date, Run time, Hospital name, Physician name, RAO/LAO
- Creation of exportable items:
  - movies (AVI format)
  - snapshots (jpeg format)
  - The step 5, 6 and 7 are not mandatory.

5. Calibration
To create a StentBoost image no calibration is needed. For the measurement support tool four calibration methods are included:

- No calibration
- Auto calibration based on calibration data generated by the Allura Xper system when the autocall function is installed (MCV5681),
- Marker distance of the stent delivery markers,
- Catheter calibration

6. "Measurement"
"Measurement" an option within the StentBoost package supports the clinician in his/her decision-making in determining the percentage of remaining stenosis in the stent.

7. Archiving
Transfer to

- Optional Hard copy unit (DICOM Print)
- Optional third party station (snapshots images in DICOM Secondary Capture format)
- Any computer via a web server functionality with images in a standard file format (JPEG, AVI movies)
- One or multiple DVD's, CD-ROM(s) for easy archiving
- Store a subset of exportable objects (snapshots and AVI Movies) to a USB removable memory device.

8. StentBoost release 2.0 comprises:

- StentBoost release 2.0 Software Package
- User manual on compact disc

FOR INFORMATION PURPOSES ONLY
THIS IS A SUMMARY SHEET NOT A QUOTE

Line #	Part #	Description	Qty

- Software release bulletin
- DICOM Conformance Statement
- StentBoost IQ verification Phantom

9. Compatible with:

- Allura Xper FD10 R 1.x
- Allura Xper FD20
- Allura Xper FD10 R. 2
- Allura Xper FD10/10

10. Pre-requisite for StentBoost R 2.0:

- Interventional Hardware (NCVA106)

3 **NCVA086 **Rotational Scan** 1

Rotational Scan provides real-time 3D impressions of complex vasculature and the coronary artery tree. It acquires multiple projections with just one contrast injection.

Rotational Scan can be used during screening procedures to quickly determine the optimal projection for the study as the angle (rotation/angulation) of the projection is indicated on each image.

Compared with traditional angiography Rotational Scan can save considerable time dose and contrast while providing image detail required for diagnostic and therapeutic decisions.

Rotational Scan is possiblewith the Allura Xper systems in the side position (ceiling mounted systems) and in the head position which provides the flexibility to perform procedures virtually from head to toe.

FOR INFORMATION PURPOSES ONLY
THIS IS A SUMMARY SHEET NOT A QUOTE

With Allura Xper FD20

C-arm in side position:

- Max. rotation speed: 30°
- Max. rotation angle: 180°

C-arm in head position:

- Max. rotation Speed: 55°
- Max. rotation Angle: 305°

With Allura Xper FD10:

Poly G in side position (ceiling version):

- Max. rotation Speed: 30°
- Max. rotation Angle: 90°

Poly G in head position:

1421

Line #	Part #	Description	Qty

- Max. rotation Speed: 55°
- Max. rotation Angle: 240°

Maximum speeds are given by the framespeed specifications of the system configuration.

The speed and range of rotation are the highest available (see table). The very high speed allows using less contrast whereas the very wide rotation range provides a complete evaluation of the anatomy.

The stand is designed forvery high mechanical stability. It offers precise positioning and high reproducibility assuring you of high quality images and excellentstudies.

Operation of Rotational Scan is extremely easy. The procedure is selected set up and executed virtually within a matter of seconds supporting the highest patient throughput. A set of dedicated acquisition programs is available on the Xper Module and can be selected at the touch of a button. The rotation endand start positions are easily selected. The procedure is controlled from theexposure hand

- or foot-switch.

4 **NCVB209 Xper Swing 1

XperSwing allows dual-axis rotational coronary angiography to gather more information in less time and with less X-ray and contrast dose. XperSwing acquires simultaneous RAO/LAO cranial-caudal views in just one acquisition run by moving the C-arm in a curved trajectory instead of multiple acquisitions. XperSwing can be used during screening procedures to quickly determine the optimal projection for the study as the angle (rotation/angulation) of the projection is indicated on each image, providing image detail required for diagnostic and therapeutic decisions and to obtain a real-time 3D impression of the coronary artery tree.

In total seven pre-programmed trajectories are available:
• Three for Left coronary imaging
• Two for Right Coronary imaging,
• Two generic trajectories.
The choice depends on size and weight of the patient. These trajectories are designed to fully cover all conventional projections for a diagnostic coronary angiography. Rotation and angulation movements are combined in one complete scan trajectory, using the maximum rotation and angulation speed of the Allura system. (55 resp 30 degr/sec). XperSwing is possible in the side position (ceiling mounted systems) and in the head position

XperSwing functionality includes, but is not limited to

• 15 frames per seconds acquisition to allows using of less contrast.
• Wide rotation range provides a complete evaluation of the anatomy.
• Precise positioning and high reproducibility, assuring you of high quality images and excellent subtraction studies.
• Set up and executed in a matter of seconds.
• Set of dedicated acquisition programs with the trajectories available on the Xper Module
• The rotation end- and start-positions can be selected.
• Acquisition procedure is controlled from the exposure hand or footswitch.

5 **NCVA785 Coronary Quant.Sw pkg(Xper) 1

1422

Line #	Part #	Description	Qty

Functions:

- diameter measurement along the selected segment
- cross sectional area
- %-stenosis
- pressure gradient values
- stenotic flow reserve
- calibration routines

In addition the package allows manual measurements of line lengths (absolute and ratio's) and angulations. Multiple measurements in one image are possible.

Comprising:

- software license

Compatible with:
. Allura Xper FD 10 Rel 3 and FD10/10 Rel 2 onwards
. Allura Xper FD20 Rel 2, FD20/10 Rel 2 onwards

PHILIPS PRODUCT WARRANTY

CARDIOVASCULAR (CV) SYSTEMS

This product warranty document is an addition to the terms and conditions set forth in the quotation to which this warranty document is attached. The terms and conditions of the quotation are incorporated into this warranty document. The capitalized terms herein have the same meaning as set forth in the quotation.

TWELVE-MONTH SYSTEM WARRANTY
Philips warrants to Customer that the Philips Vascular and Cardiac Systems (the "System") as delivered to Customer will perform in substantial compliance with its performance specifications for a period of twelve (12) months upon first patient use. Any glassware or flat detectors provided with the System is subject to special warranty terms set forth below.

PLANNED MAINTENANCE
During the warranty period, Philips personnel will schedule planned maintenance visits, in advance, at a mutually agreeable time on weekdays, between 8:00 A.M. and 5:00 P.M. local time, excluding Philips observed holidays.

SYSTEM UPGRADES
Any commercially available upgrade to the System which is hereafter installed by Philips during the original term of the System warranty shall be subject to the warranty terms contained in the first paragraph of this warranty, except that such warranty shall expire on the later of: a) upon termination of the initial twelve (12) month warranty period for the System on which the upgrade is installed or b) after ninety (90) days for parts only from the date of installation.

MRC X-RAY TUBES
Philips warrants to Customer, for the warranty periods further specified in this section, that the Philips X-Ray tube will be substantially free from defects in material and manufacturing workmanship, which impair performance under normal use as specified in Philips product descriptions and specifications.

The warranty period for MRC tubes provided with Customer's purchase of a new or refurbished X-ray system shall be the shorter of thirty-six (36) months after installation or thirty-eight (38) months after date of shipment from Philips. The warranty period for purchases of replacement tubes shall be the shorter of twelve (12) months after installation or fourteen (14) months after date of shipment from Philips.

MRC TUBE WARRANTY EXCLUSION
The above warranty shall not apply to X-ray tubes outside the United States and Canada. Philips' obligations under the product warranty do not apply to any product defects resulting from: improper or inadequate maintenance or calibration by Customer or its agents; Customer or third party supplied software, interfaces, or supplies; use or operation of the product other than in accordance with loss, or damage in transit; improper site preparation; unauthorized maintenance or Philips' applicable product specifications and written instructions; abuse, negligence, accident, modifications to the product; or, to viruses or similar software interference resulting from the connection of the product to a network.

MRC TUBE WARRANTY REMEDIES
If a tube is found to fail during the warranty period, and if, in the best judgment of Philips, the failure is not due to neglect, accident, improper installation, use contrary to instructions, or the exclusions stated above, Philips' tube warranty liability hereunder is limited to, at Philips option, the repair or replacement of the tube. Any replacement tube would have a warranty period equal to the balance of the warranty period left on the tube replaced.

IMAGE INTENSIFIER TUBES
Philips warrants the image intensifier tubes provided with the System, if any, will be free from defects in material and manufacturing workmanship for twenty-four (24) months. Claims must be made within twenty-four (24) months after installation or twenty-seven (27) months after date of shipment from Philips, whichever occurs first. If an image intensifier tube fails to meet this warranty, as Customer's sole and exclusive remedy, upon return of the tube, Philips will provide a prorated credit towards the purchase of a replacement tube from Philips as follows:

USAGE				CREDIT
0	to within	12	months	100%
12	to within	13	months	50%
13	to within	14	months	46%
14	to within	15	months	42%
15	to within	16	months	37%
16	to within	17	months	33%
17	to within	18	months	29%
18	to within	19	months	25%
19	to within	20	months	21%
20	to within	21	months	17%
21	to within	22	months	12%
22	to within	23	months	8%
23	to within	24	months	4%

Tubes received by Philips under this warranty that are found to meet all test specifications will be returned to the Customer and the warranty will continue as to the original date of installation. Examination of the returned tube may necessitate its destruction, but Philips' liability shall, in any case, be limited to repair or replacement as aforesaid, only if in its sole opinion the tube has been properly used, installed and applied and has not been subjected to neglect, accident, improper installation or use. Transportation charges and risk of loss, both ways, of returned or replaced tubes shall be at the expense of the Customer.

DYNAMIC FLAT DETECTORS
Philips warrants the flat detectors provided with the System will be free from defects in material and manufacturing workmanship for twelve (12) months. Claims must be made within twelve (12) months after installation or fifteen (15) months after date of shipment from Philips, whichever occurs first. If a detector fails to meet this warranty, as Customer's sole and exclusive remedy, upon return of the detector, Philips will provide Customer a replacement detector at no additional charge.

SYSTEM SOFTWARE AND SOFTWARE UPDATES
The software provided with the System will be the latest version of the standard software available for that System as of the 90th day prior to the date the System is delivered to Customer. Updates to standard software for the System that do not require additional hardware or equipment modifications will be performed as a part of normal warranty service during the term of the warranty.

All software is and shall remain the sole property of Philips or its software suppliers. Use of the software is subject to the terms of a separate software license agreement. Customer must sign all such license agreements prior to or upon the delivery of the product. No license or other right is granted to Customer or to any other party to use the software except as set forth in the license agreements.

Any Philips maintenance or service software and documentation provided with the product and/or located at Customer's premises is intended solely to assist Philips and its authorized agents to install and to test the System, to assist Philips and its authorized agents to maintain and to service the System under a separate support agreement with Customer, or to permit Customer to maintain and service the System. Customer agrees to restrict the access to such software and documentation to Philips' employees and those of its authorized agents, and to authorized employees of Customer only.

WARRANTY LIMITATIONS
Philips' obligations under the System warranty are limited, at Philips' option, to the repair or the replacement of the System or a portion thereof, or to a credit or refund of a portion of the purchase price paid by Customer. Any refund or credit will be paid to Customer when the System is returned to Philips. Certain of the parts used in the manufacture or installation of, or in the replacement parts for, this System may contain refurbished components. If such components are used, they will be subject to the same quality control and inspection procedures as all other components in the System. Any System warranty is made on condition that Philips receives written notice of a System defect during the warranty period, and within thirty (30) days following the discovery of the defect by Customer. Philips' obligations under the System warranty do not apply to any System defects resulting from: improper or inadequate maintenance or calibration by Customer or its agents; Customer or third party supplied software, interfaces, or supplies; use or operation of the product other than in accordance with loss, or damage in transit; improper site preparation; unauthorized maintenance or Philips' applicable product specifications and written instructions; abuse, negligence, accident, modifications to the System; or to viruses or similar software interference resulting from the connection of the product to a network. Philips does not provide a warranty for any such third party products furnished to Customer by Philips; however, Philips shall use reasonable efforts to extend to Customer the third party warranty for the product. The obligations of Philips described above are Philips' only obligations and Customer's sole and exclusive remedy for a breach of a System warranty. Repairs or replacement parts do not extend the term of this warranty.

FOR INFORMATION PURPOSES ONLY
THIS IS A SUMMARY SHEET NOT A QUOTE

THE WARRANTIES SET FORTH IN THIS WARRANTY DOCUMENT WITH RESPECT TO THE SYSTEM (INCLUDING THE SOFTWARE PROVIDED WITH THE SYSTEM), GLASSWARE, AND DETECTORS ARE THE ONLY WARRANTIES MADE BY PHILIPS IN CONNECTION WITH THE SYSTEM, SOFTWARE, GLASSWARE, DETECTORS, AND THE TRANSACTIONS CONTEMPLATED BY THE QUOTATION, AND ARE EXPRESSLY IN LIEU OF ANY OTHER WARRANTIES, EXPRESS OR IMPLIED INCLUDING, WITHOUT LIMITATION, ANY WARRANTY OF MERCHANTABILITY OR FITNESS FOR A PARTICULAR PURPOSE.

ACCESS TO SYSTEM
Philips shall have full, free and safe access to the System and Customer's operation, performance and maintenance records for the System, on each scheduled or requested warranty service visit. Philips shall also have access to and use of any machine, service, attachment, features or other equipment required to perform the necessary service contemplated herein at no charge to Philips. Customer waives warranty service if it does not provide such access to the System and Customer's records. Should Philips be denied access to the System and Customer's records at the agreed upon time, a charge equal to the appropriate hourly rate will be accepted by Customer for "waiting time."

WARRANTY SERVICE
In the event it is not possible to accomplish warranty service within normal working hours (8:00 A.M. to 5:00 P.M., Monday through Friday, excluding Philips observed holidays), or in the event Customer specifically requests that warranty service be performed outside of Philips normal working hours, Customer agrees to pay for such services at Philips standard service rates in effect. Maintenance Agreements are available for extended coverage.

TRANSFER OF SYSTEM
In the event Customer transfers or relocates the System, all obligations under this warranty will terminate unless Customer receives the prior written consent of Philips for the transfer or relocation. Upon any transfer or relocation, the System must be inspected and certified by Philips as being free from all defects in material, software and workmanship and as being in compliance with all technical and performance specifications. Customer will compensate Philips for these services at the prevailing service rates in effect as of the date the inspection is performed. Any System which is transported intact to pre-approved locations and is maintained as originally installed in mobile configurations will remain covered by this warranty.

CONDITIONS
This warranty is subject to the following conditions: the System (a) is to be installed by authorized Philips representatives (or is to be installed in accordance with all Philips installation instructions by personnel trained by Philips), (b) is to be operated exclusively by duly qualified personnel in a safe and reasonable manner in accordance with Philips written instructions and for the purpose for which the products were intended, (c) is to be maintained and in strict compliance with all recommended and scheduled maintenance instructions provided with the System, and (d) Customer is to notify Philips immediately in the event the System at any time fails to meet its printed performance specifications.

LIMITATIONS OF LIABILITY AND DISCLAIMERS
The liability, if any, of Philips AND ITS AFFILIATES for damages whether arising from breach of the terms in the quotation, breach of warranty, negligence, indemnity, strict liability or other tort, or otherwise with respect to the products and services is limited to an amount not to exceed the price of the product or service giving rise to the liability.

IN NO EVENT SHALL PHILIPS OR ITS AFFILIATES BE LIABLE FOR ANY INDIRECT, PUNITIVE, INCIDENTAL, CONSEQUENTIAL, OR SPECIAL DAMAGES, INCLUDING WITHOUT LIMITATION, LOST REVENUES OR PROFITS, OR THE COST OF SUBSTITUTE PRODUCTS OR SERVICES WHETHER ARISING FROM BREACH OF THE TERMS IN THIS QUOTATION, BREACH OF WARRANTY, NEGLIGENCE, INDEMNITY, STRICT LIABILITY OR OTHER TORT. PHILIPS SHALL HAVE NO LIABILITY FOR ANY GRATUITOUS ADVICE PROVIDED TO THE CUSTOMER.

FORCE MAJEURE
Philips and Customer shall each be excused from performing its obligations arising from any delay or default caused by events beyond its reasonable control including, but not limited to: acts of God, acts of third parties, acts of the other party, acts of any civil or military authority, fire, floods, war, embargoes, labor disputes, acts of sabotage, riots, accidents, delays of carriers, subcontractors or suppliers, voluntary or mandatory compliance with any government act, regulation or request, shortage of labor, materials or manufacturing facilities.

IN REPLY REFER TO
T:E:E:4
VCJ

JAN 6 1960

Hartford Hospital
Hartford 15, Connecticut

Gentlemen:

This refers to your letter of November 13, 1959 in which you state that you received a ruling from this office dated August 11, 1953, exempting you from Federal income tax under the provisions of section 101(6) of the Internal Revenue Code. This ruling also had the effect of affirming prior rulings dated August 28, 1934, September 19, 1938 and January 27, 1941. You are now requesting that your status be brought up to date to conform with the 1954 Code, section 501(c)(3).

Treasury Regulations prescribed under the Internal Revenue Code of 1954 provide at section 1.501(a)-1(a)(2), as amended by Treasury Decision 6391, published June 26, 1959, for situations such as yours and read, in part, as follows:

> "Subject only to the Commissioner's inherent power to revoke rulings because of a change in the law or regulations or for other good cause, an organization that has been determined by the Commissioner or the district director to be exempt under section 501(a) or the corresponding provision of prior law may rely upon such determination so long as there are no substantial changes in the organization's character, purposes, or methods of operation. An organization which has been determined to be exempt under the provisions of the Internal Revenue Code of 1939 or prior law is not required to secure a new determination of exemption merely because of the enactment of the Internal Revenue Code of 1954 unless affected by substantive changes in law made by such Code."

In view of the present Regulations you are not required to have your existing exempt status affirmed under the 1954 Code in the absence of basic changes in your organization and/or operations. If you prefer, as a matter of convenience, to have a current ruling on your

status it will be necessary for you to file a new exemption application, Form 1023, with your District Director at Hartford, Connecticut, together with all supporting documents required by the application, as well as a statement in some detail concerning your activities subsequent to 1953. Inasmuch as we have on file the copies of your charter and by-laws submitted with your prior application, further copies of these documents need not be furnished, but any amendments subsequent to July 1953 should be supplied. For your use in this connection, there are enclosed three copies of Form 1023, two executed copies of which may be filed and the third may be retained for your use.

A cursory examination of your charter shows that it does not specify that you are organized as a nonprofit charitable hospital, contains no provision requiring you to be operated to the extent of your financial ability for those not able to pay for the services rendered, and other requirements of Revenue Ruling 56-185, published in Internal Revenue Bulletin 1956-1, page 202, which establishes the criteria to be met in determining whether a hospital qualifies for exemption as an organization described in section 501(c)(3) of the 1954 Code. Further, your charter does not contain any provision impressing your assets with a trust by providing that in the event of dissolution your assets are required to be distributed for one or more of the purposes described in section 501(c)(3). In this connection your attention is invited to section 1.501(c)(3)-1(b)(6) of the Regulations which reads, in part, as follows:

> "Applicability of the organizational test. A determination by the Commissioner or a district director that an organization is described in section 501(c)(3) and exempt under section 501(a) will not be granted after July 26, 1959 (regardless of when the application is filed), unless such organization meets the organizational test prescribed by this paragraph. If, before July 27, 1959, an organization has been determined by the Commissioner or district director to be exempt as an organization described in section 501(c)(3) or in a corresponding provision of prior law and such determination has not been revoked before such date, the fact that such organization does not meet the organizational test prescribed by this paragraph shall not be a basis for revoking such determination. Accordingly, an organization which has been determined to be exempt before July 27, 1959, and which does not seek a new determination of exemption is not required to amend its articles of organiza-

tion to conform to the rules of this paragraph, but any organization which seeks a determination of exemption after July 26, 1959, must have articles of organization which meet the rules of this paragraph.
* * *"

This office is also in receipt of a communication, dated April 16, 1959, from Shipmen & Goodwin, Counselors at law, Hartford, Connecticut, submitting in your behalf a request for a ruling on certain proposed transaction contemplated by you with respect to their effect on your exempt status. You are advised that our reply to this request will be held in abeyance pending receipt of advice from you as to what further action you intend to take with regard to having your status affirmed under the Internal Revenue Code of 1954.

Your reply should also contain information concerning any implementing action which you may have taken subsequent to April 1959 with regard to the proposed transactions.

Your reply should be directed to the attention of T:R:EO:4-VCS.

Very truly yours,

E. F. Wadley

Dear Taxpayer:

This is in response to your Mar. 28, 2014, request for information regarding your tax-exempt status.

Our records indicate that you were recognized as exempt under section 501(c)(3) of the Internal Revenue Code in a determination letter issued in Dec 1951.

Our records also indicate that you are not a private foundation within the meaning of section 509(a) of the Code because you are described in section(s) 509(a)(1) and 170(b)(1)(A)(iii).

Donors may deduct contributions to you as provided in section 170 of the Code. Bequests, legacies, devises, transfers, or gifts to you or for your use are deductible for Federal estate and gift tax purposes if they meet the applicable provisions of sections 2055, 2106, and 2522 of the Code.

Please refer to our website www.irs.gov/eo for information regarding filing requirements. Specifically, section 6033(j) of the Code provides that failure to file an annual information return for three consecutive years results in revocation of tax-exempt status as of the filing due date of the third return for organizations required to file. We will publish a list of organizations whose tax-exempt status was revoked under section 6033(j) of the Code on our website beginning in early 2011.

OFFICE OF
COMMISSIONER OF INTERNAL REVENUE

ADDRESS REPLY TO
COMMISSIONER OF INTERNAL REVENUE
AND REFER TO

IT:P:ER-TUC

DEC 14 1951

The William W. Backus Hospital

Norwich, Connecticut

Gentlemen:

It is the opinion of this office, based upon the evidence presented, that you are exempt from Federal income tax under the provisions of section 101(6) of the Internal Revenue Code and corresponding provisions of prior revenue acts, as it is shown that you are organized and operated exclusively for charitable purposes.

Accordingly, you will not be required to file income tax returns unless you change the character of your organization, the purposes for which you were organized, or your method of operation. Any such changes should be reported immediately to the collector of internal revenue for your district in order that their effect upon your exempt status may be determined.

You will be required, however, to file an information return, Form 990A, annually, with the collector of internal revenue for your district so long as this exemption remains in effect. This form may be obtained from the collector and is required to be filed on or before the fifteenth day of the fifth month following the close of your annual accounting period.

Contributions made to you are deductible by the donors in computing their taxable net income in the manner and to the extent provided by section 23(o) and (q) of the Internal Revenue Code, as amended, and corresponding provisions of prior revenue acts.

Bequests, legacies, devises, or transfers, to or for your use are deductible in computing the value of the net estate of a decedent for estate tax purposes in the manner and to the extent provided by sections 812(d) and 861(a)(3) of the Code and corresponding provisions of prior revenue acts. Gifts of property to you are deductible in computing net gifts for gift tax purposes in the manner and to the extent provided in section 1004(a)(2)(B) and 1004(b)(2) and (3) of the Code and corresponding provisions of prior revenue acts.

Form 6978—Rev. Dec. 1950
(1491M-1)

1436

16—61990-2 GPO

In the event you have not filed a waiver of exemption certificate in accordance with the provisions of section 1426(1) of the Code, no liability is incurred by your organization for the taxes imposed under the Federal Insurance Contributions Act. Tax liability is not incurred by your organization under the Federal Unemployment Tax Act by virtue of the provisions of section 1607(c)(8) of such Act.

The collector of internal revenue for your district is being advised of this action.

Bureau ruling dated September 19, 1934, in which you were held exempt under the provisions of section 103(6) of the Revenue Act of 1932 and corresponding provisions of prior revenue acts and Bureau ruling dated April 27, 1938, which affirmed that ruling under the Revenue Act of 1936 are hereby affirmed.

By direction of the Commissioner.

Very truly yours,

Deputy Commissioner

September 30, 2015

David A. Whitehead
President
The William W. Backus Hospital
326 Washington Street Norwich, CT 06360

Dear Mr. Whitehead,

Please accept this letter of support for the development of a Primary and Elective Percutaneous Cardiac Intervention (PCI) program at The William W. Backus Hospital.

Although I am not a healthcare expert, I have experienced angioplasty firsthand and do know that timing is everything when it comes to a cardiac emergency. As state representative, I fully support your proposal, which would give residents in the communities I represent timely access to PCI.

Currently, residents in Killingly, Putnam, and Thompson do not have access to a PCI-capable facility within a 30-minute drive time. This lack of access should not exist-our families, friends, and neighbors should not be at a disadvantage when it comes to their health, just because of where they live.

Having this service available at Backus Hospital would improve quality of life, make our region a more attractive place to live and, most importantly, save lives.

Please accept this letter of support-Backus should be applauded for its commitment to offering Percutaneous Cardiac Intervention, close to home for patients.

Sincerely,

Daniel Rovero
State Representative

9/08/2015

Dave Whitehead
President
The William W. Backus Hospital
326 Washington St.
Norwich, CT 06360

Dear Mr. Whitehead:

We are excited to support The William W. Backus Hospital and its proposal to build and operate a Percutaneous Coronary Intervention program in Norwich.

This investment is much needed. Although currently many of our residents and neighbors utilize Backus Hospital healthcare services, many cardiac emergency situations mean our volunteer ambulance company and other emergency personnel must transport patients suffering from life-threatening conditions out of our community to more distant facilities. This distance means one call can tie up an emergency vehicle and its EMS personnel for a significant amount of time. Since we are a small community resources are limited and the extended away time can be crucial.

Your proposal to provide Percutaneous Coronary Intervention would improve patient safety and make our EMS network much more efficient. It is a service that we lack in our community, and that our residents deserve to have. Our community is currently at a disadvantage without such a vital program. The proposal to add such a program is yet another example of Backus Hospital's commitment to improving healthcare in the communities in which it serves.

We support the project wholeheartedly, and look forward to the project's approval and completion.

Sincerely,

Jody Grenier

Subject: 15-32031 CON - Backus PCI Program

Dear Ms. Edwards:

On September 30, 2015, OHCA received the Certificate of Need application of The William W. Backus Hospital and Hartford Hospital to establish a primary and elective percutaneous coronary intervention (PCI) program at Backus Hospital. OHCA requests additional information pursuant to Connecticut General Statutes §19a-639a(c). *Please electronically confirm receipt of this email as soon as you receive it.* Provide responses to the questions below in both a Word document and PDF format as an attachment to a responding email, at your earliest convenience.

Repeat each question before providing your response and paginate and date your response, i.e., each page in its entirety. Information filed after the initial CON application submission (e.g., completeness response letter, prefile testimony, late file submissions and the like) must be numbered sequentially from the Applicant's document preceding it. Begin your submission using **Page 1438** and reference "**Docket Number: 15-32031-CON**."

1. Explain the reasoning for 24% growth rate in PCIs (page 69), given declining state and national PCI trends. OHCA Hospital Reporting System Report 450 data indicates a 12% decline in CT primary and elective PCIs. The SCAI/ACC/AHA Expert Consensus Document 2014 Update (Exhibit 1 of application) also indicates that nationally, PCI volumes have dropped 30% due to factors such as increased emphasis on use of other treatment modalities including medical therapy and improved preventions efforts.

2. Explain the clear public need for the proposed service when statewide PCI discharge volumes are declining.

3. To what percentage of the projected PCI patients associated with the proposal do the DPH Regulations on page 93 apply? Discuss in detail how the regulations apply to elective angioplasty patients and the relevance of a 30-minute drive time.

4. Using the service area defined in the table below, update FY 2015 numbers through the end of the fiscal year for the tables on pages 46, 62, 101 102, 103 and 104. If full year data is unavailable, update the 2015 numbers through the most recent month available and identify that month.

5. Explain the decreases in the number of diagnostic catheterizations and transfers reflected on Figure 20 on page 62.

   The table below shows inpatient PCI discharges from Backus Hospital's primary services area+ towns:

FY 2014 PCI Discharges from Backus Hospital Primary Service Area+

	PCI Hospital						
Primary Service Area Patient Towns	Yale	Hartford	L&M	St. Francis	John Dempsey	Central CT	**Total**

Source: *CT DPH Office of Health Care Access Acute Care Hospital Inpatient Discharge Database*

*ICD-9-CM Procedure Codes: .66, 36.01, 36.02, 36.05, 36.06, 36.07 & 36.09

Please note: unduplicated counts utilizing all procedure codes

+Primary service area towns make up the top 75% of a hospital inpatient discharges.

Cells sizes less than six are masked for patient confidentiality

6. Given that Yale, Hartford and L+M are the PCI providers listed on page 46, as well as St. Francis, John Dempsey and Central CT shown in the table above also serve Backus' service area patients, explain:
    a. Why the proposal is not an unnecessary duplication of existing health care services currently available;
    b. How the proposal will not result in a shift in volumes from existing providers; and
    c. How there will be no impact on existing provider.

7. Discuss and describe the existing referral base (physicians and physician practices, specifically the interventionalists) in the service area defined in the table above.

8. Page 25 indicates physician alignment requirements have been met. Explain what the alignment is at Backus Hospital and its impact on the proposed services.

9. Describe in detail the proposed on-call system with physicians at Hartford Hospital and Hartford Cardiac Laboratory, P.C. and Dr. John Michael Chua Chiaco to ensure continuous 24/7 coverage.

10. Provide a copy of the on-call schedule for the physicians that will provide coverage for the proposed program.

11. In a table format, provide angioplasty volumes, separated by primary and elective procedures, for each of the physicians in the proposed program for the most recent full fiscal year, and indicate the year.

12. Table 6 on page 78 shows a projected 2% increase in PCIs from FY16 to FY18. Please elaborate on the assumptions used to arrive at the growth rate.

13. On page 459, PCIs are defined to include ICD-9 CM procedure code 17.55 and NSTEMIs to include ICD-9-CM diagnoses codes 426.2 – 426.3. Explain each inclusion and provide a source/citation.

14. Revise and resubmit the payer mix table on page 79 as the rows appear to have shifted downward and are not correctly aligned. In addition, provide the assumptions used for the projected population mix.

15. Page 67 indicates a capital expenditure of $4.8 M for an additional cath lab, software and equipment update and allowances for ongoing capital needs. Page 62 shows a 32% decline in cardiac caths between 2012 and 2014. Explain the need for an additional cath lab.

16. Confirm the projection of 385 PCIs in year 5 in order to achieve operating gains.

Note that pursuant to Section 19a-639a(c) of the Connecticut General Statutes, you must submit your response to this request no later than sixty days from the date of this email transmission. Therefore, provide your written responses to OHCA no later than December 30, 2015, otherwise your application will be automatically considered withdrawn. ***Please email your responses to all of the following email addresses:*** **OHCA@ct.gov, jessica.schaeffer-helmecki@ct.gov,*olga.armah@ct.gov*, *kaila.riggott@ct.gov*; david.fernandes@ct.gov.** If you have any questions concerning this letter, feel free to contact me at 860-418 7070 or Jessica Schaeffer-Helmecki at (860) 509-8075.

Re: Docket No. 15-32031-CON
Revised CON Exhibit 24 - Financial Worksheet A
Completeness Responses with Exhibit 28 & Exhibit 29

Dear Ms. Martone:

On behalf of Hartford Hospital and The William W. Backus Hospital, enclosed please find a revised copy of Exhibit 24 – Financial Worksheet A to the Certificate of Need application (originally page 1409 in the CON). The Applicants recently discovered the payor mix in Financial Worksheet A was calculated using gross revenue instead of net. A revised Exhibit 24 with the correction made is attached.

Also attached are the Applicants' Completeness Responses (and associated Exhibit 28 & Exhibit 29). Per Ms. Armah's October 30, 2015 request, this submission has been e-filed with the individuals identified above and no hard copies are being provided. A PDF version of the filing in its entirety as well as a Word version of the Completeness Response and an Excel version of the Revised Exhibit 24 are also included.

Please do not hesitate to contact me if you have any questions.

Very truly yours,

BROWN RUDNICK LLP

STATE OF CONNECTICUT
DEPARTMENT OF PUBLIC HEALTH
OFFICE OF HEALTH CARE ACCESS

IN RE:	**:**	**DOCKET NO. 15-32031-CON**
	:	
THE WILLIAM W. BACKUS HOSPITAL AND HARTFORD HOSPITAL'S CERTIFICATE OF NEED APPLICATION TO ESTABLISH A PRIMARY AND ELECTIVE PERCUTANEOUS CORONARY INTERVENTION (PCI) PROGRAM AT BACKUS HOSPITAL.	**:**	**December 30, 2015**

RESPONSES TO COMPLETENESS QUESTIONS

1. **Explain the reasoning for 24% growth rate in PCIs (page 69), given declining state and national PCI trends. OHCA Hospital Reporting System Report 450 data indicates a 12% decline in CT primary and elective PCIs. The SCAI/ACC/AHA Expert Consensus Document 2014 Update (Exhibit 1 of application) also indicates that nationally, PCI volumes have dropped 30% due to factors such as increased emphasis on use of other treatment modalities including medical therapy and improved preventions efforts.**

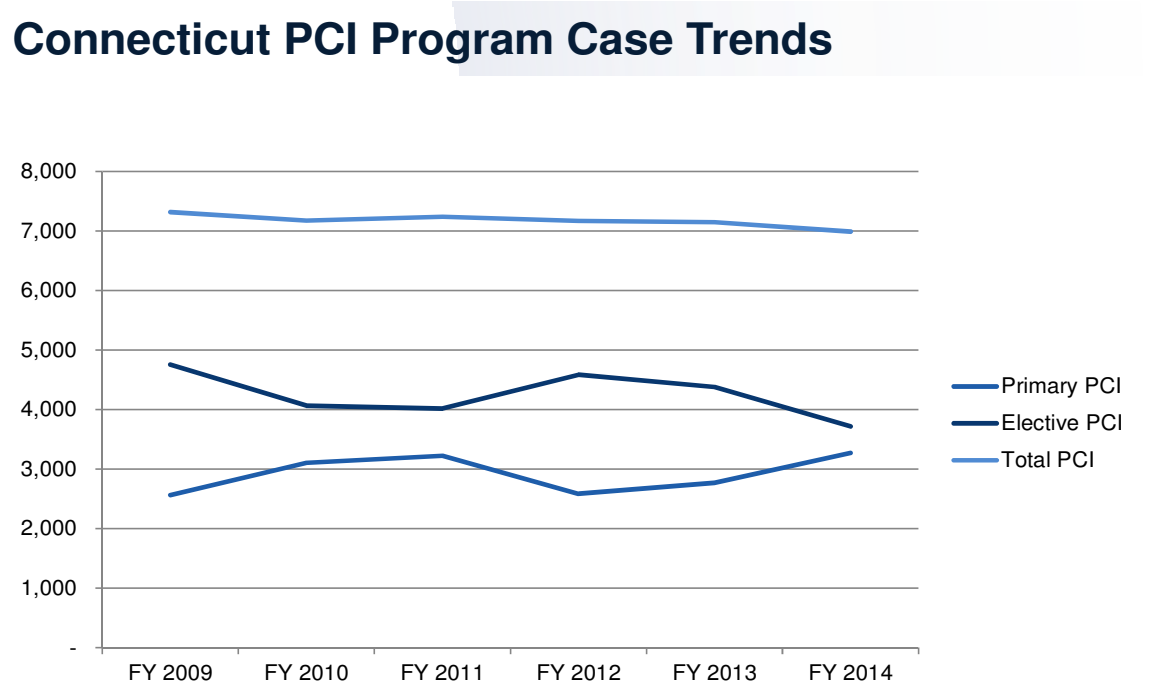
   The 24% growth rate is specific to the service area defined on page four (referred to as the Angioplasty Region) of the 3d Health Assessment (CON, Exhibit 8, Page 447), and was calculated by applying age-gender specific average use rates developed using six years (FY 2009 through FY 2014) of historic utilization data. The use rates do not incorporate state or national trends that may not be relevant to the healthcare landscape in Eastern Connecticut, but instead rely on the demographics and disease burden in the Angioplasty Region communities to predict need for PCI intervention.

   As shown on page 15 of the 3d Health Assessment (CON, Exhibit 8, Page , 462), Acute MI inpatient volumes in the defined service area have increased by more than twelve percent over the past six years. Additionally, the incidence rate of STEMI per 100,000 is significantly higher than both the state and national rates, as seen on page 16 of the 3d Health Assessment (CON, Exhibit 8, Page 463). Due to the lack of timely access to a PCI facility for the majority of service area residents, the rate of Primary PCI and Elective PCI as an intervention is less than both state and national levels, as depicted on page 17 (CON, Exhibit 8, Page 463), leading to an estimated 71 PCI patients either seeking care at a provider outside of those listed in the report or not receiving any care at all (see the Unmet Need/Other Outmigration 2014 estimates for Primary and Elective PCI, page 41 of the 3d Health Assessment (CON, Exhibit 8, Page 488). As a point of comparison, Lawrence + Memorial, whose PCI service area has a similar demographic composition and historic lack of access, reported

to OHCA total PCI volumes of 135 in FY 2013 (page 40, 3d Health Assessment (CON, Exhibit 8, Page 487), growing to 216[1] in FY 2015.

Further, data suggests that total PCI volumes in the State of Connecticut are not declining across the board. When analyzing the OHCA Report 450 for each PCI capable hospital in Connecticut (Bridgeport, Danbury, John Dempsey, Greenwich, Hartford, Lawrence + Memorial, Waterbury, St. Mary's, Norwalk, St. Francis, St. Vincent's, Stamford, and Yale) included within each facility's Twelve Month Filing from 2009-2014 (the most current year of data available) total PCI trends remained fairly flat.

Additionally, consistent trends in Primary and Elective PCI volumes could not be determined. That is, data indicates that PCI volume is up or down in any given year; trends were not up or consistently down between 2009-2014. None of the data obtained through the OHCA report 450 indicated a 12% decline in volume.



Source: State of Connecticut Department of Public Health Office of Health Care Access Report 450

[1] *The L+M volume of 216 cases is different than the 211 reported in the CON, as the L+M volume in the CON was annualized based on three quarters of complete data. The 216 represents full 2015 L+M volume.*

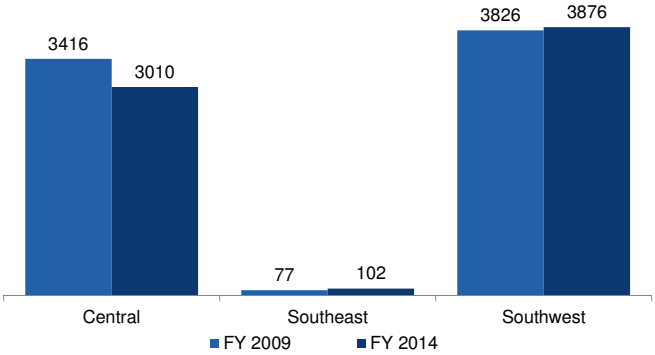
	FY 2009	FY 2010	FY 2011	FY 2012	FY 2013	FY 2014	Change FY 09-14
Primary PCI	2,562	3,106	3,224	2,586	2,770	3,273	28%
Elective PCI	4,757	4,067	4,017	4,584	4,378	3,715	(22%)
Total PCI	7,319	7,173	7,241	7,170	7,148	6,988	(5%)

Source: State of Connecticut Department of Public Health Office of Health Care Access Report 450

From 2009-2014 reported Primary PCI volumes grew by 28%. While reported Elective PCI volume declined, the reliability of the data was called into question, as this analysis revealed data integrity issues. Year-over- year hospital reporting was not consistent. For example, Lawrence + Memorial reported no Elective volume in FY 13 or 14, despite receiving approval for an Elective program in February of 2013. Lawrence + Memorial reported Elective volume, however, to OHCA per the stipulated conditions outlined within the Agreed Settlement in Docket No. 12-31768-CON, granting approval for its Elective program. This is only one example where data integrity issues were uncovered when analyzing Report 450 information. Regardless of the validity of the reported data, PCI volumes in totality only declined 5% over six years. This represents a Compound Annual Growth Rate of (.8%) per year, a modest change in volume overall.

Finally, the data found in OHCA Report 450 for Primary and Elective volume was analyzed by geographic region to determine if volume shifts existed within specific communities based on hospital location. This analysis revealed that declines in volume appear to take place in the Central part of the State (defined as aggregate volume seen by Hartford, HOCC, St. Francis, John Dempsey, Waterford, St. Mary's) while PCI volume grew over the same time period in the South East (Lawrence + Memorial Primary volume only) and the South West (defined as Yale, Bridgeport, Greenwich, Danbury, St. Vincent's, Stamford, Norwalk).

Connecticut PCI Program Case Trends by Region



Source: State of Connecticut Department of Public Health Office of Health Care Access Report 450

3

The South East region, as noted above, does not include any Elective PCI volume originating from Lawrence + Memorial , as they did not report volumes within their Twelve Month Filing. If this volume was included the growth in the South East would be even greater.

2. Explain the clear public need for the proposed service when statewide PCI discharge volumes are declining.

As discussed in response to Question 1 above, statewide PCI discharges are not consistently declining, and are not declining at all institutions. Clear public need exists in the North East corner of Connecticut for multiple reasons:

Residents in the Angioplasty Region are not receiving adequate care. *The rate of Primary PCI interventions for residents living in the Angioplasty Region defined in the 3d Health Assessment, page 4 (CON, Exhibit 8, Page 451) is **18% below** the statewide level and **8% below** the national level. The rate of Elective PCI interventions for this same population is **19% below** the statewide level and **41% below** the national level (3d Health Assessment, page 17 (CON, Exhibit 8, Page 464). These figures are especially disturbing given the characteristics of the population in this region: a larger percentage of older people as compared to state and national averages and poorer health statistics and health status, as further discussed below. In addition, MI volumes in this region have **increased 12.9%** since FY 2009 and the incidence of STEMI per 100,000 has also increased and is **significantly higher** than both the state and national levels. This region also has one of the highest coronary mortality rates in the state. Residents of the Angioplasty Region are not receiving the same level of care as the rest of the state, is in dire need of angioplasty services - and the above facts alone support such need.*

*It's also important to note that for this Region, the median door-to-balloon time for patients presenting to Backus and being treated for PCI intervention at a PCI facility was **134 minutes**, well above the recommended time of **90 minutes**; in fact, only 10% of the these patients were treated within 90 minutes. Door-in-door-out times were also calculated and found to **exceed** recommended guidelines **89% of the time** - only 11% of the time were patients treated within the recommended 30 minutes. These are life-saving, time sensitive treatments that would greatly improve the health and lives of the residents living in this isolated area. This geographic "dual standard of care" that exists today in Connecticut should not continue.*

Access to PCI services is severally restricted. *While it may be true that there is sufficient access to PCI services in many parts of Connecticut and in some areas there may actually be excess capacity and thus no need for additional PCI providers, this is not the case for residents living in the Angioplasty Region. In fact, in all of Eastern Connecticut only a small number, those in the South East region, have sufficient access to a PCI provider. Astonishingly, residents living in the Angioplasty Region, a population of more than 230,000, which makes up most of North/North East Connecticut, do not. These residents must travel significant distances for this life saving procedure. The table below shows drive time estimates to the closest PCI facility for communities centrally located within the Angioplasty Region. The drive times are minimums and reflect trips that take place during the very best conditions - outside of morning or evening rush hours and on dry roads. Traffic, construction and inclement weather are familiar and frequent challenges to Connecticut*

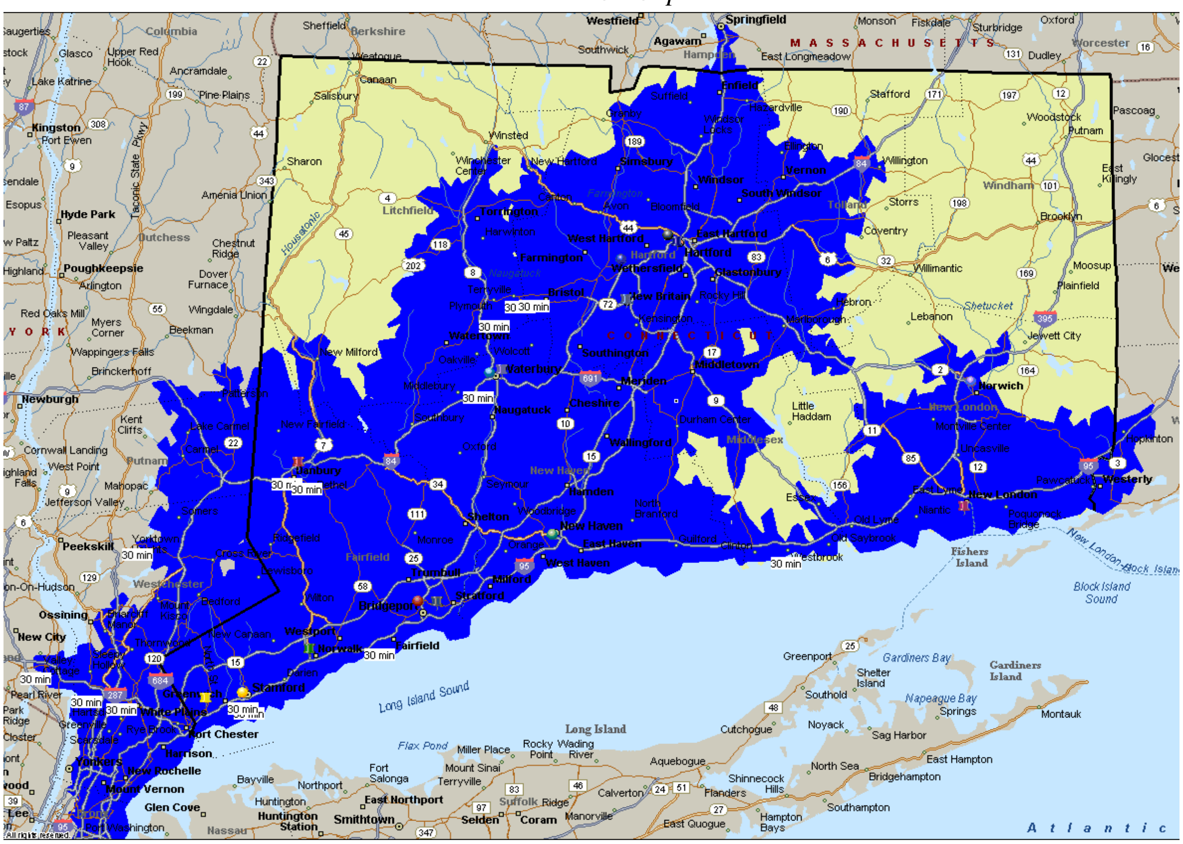
travelers. A PCI program at Backus would be a tremendous benefit to residents of the Angioplasty Region - 80% of whom live within 30 minutes of Backus and would have sufficient access to PCI services; and for the remaining 20%, Backus would be the closest provider of PCI services.

Average Drive Time			
	Brooklyn	***Plainfield***	***Windham***
Backus	*28 minutes*	*17 minutes*	*20 minutes*
Hartford	*55 minutes*	*57 minutes*	*43 minutes*
Lawrence + Memorial	*47 minutes*	*36 minutes*	*39 minutes*

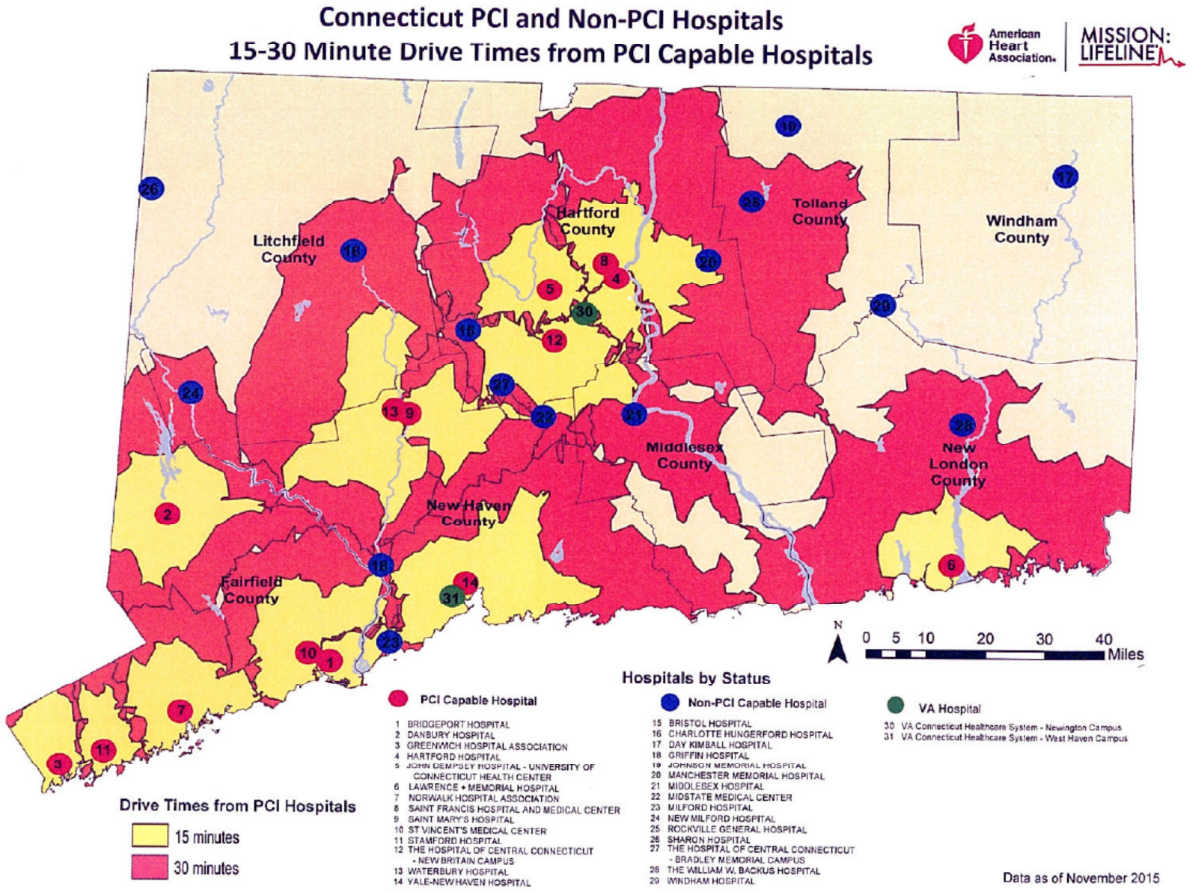
Source: 3d Health Assessment, page 34 (CON, Exhibit 8, Page 481)

The map below highlights the inequitable distribution of PCI services throughout Connecticut - there are twelve PCI providers in the western half of Connecticut and only one in the eastern half. Residents in many regions, such as Greater Hartford, Greater Waterbury and Greater New Haven, have immediate access to two or more PCI providers in or nearby the communities in which they live. In eastern Connecticut, only a small number, those in the southeast region, have a local PCI provider (Lawrence and Memorial), while residents living in the Angioplasty Region must travel significant distances for this life saving procedure.

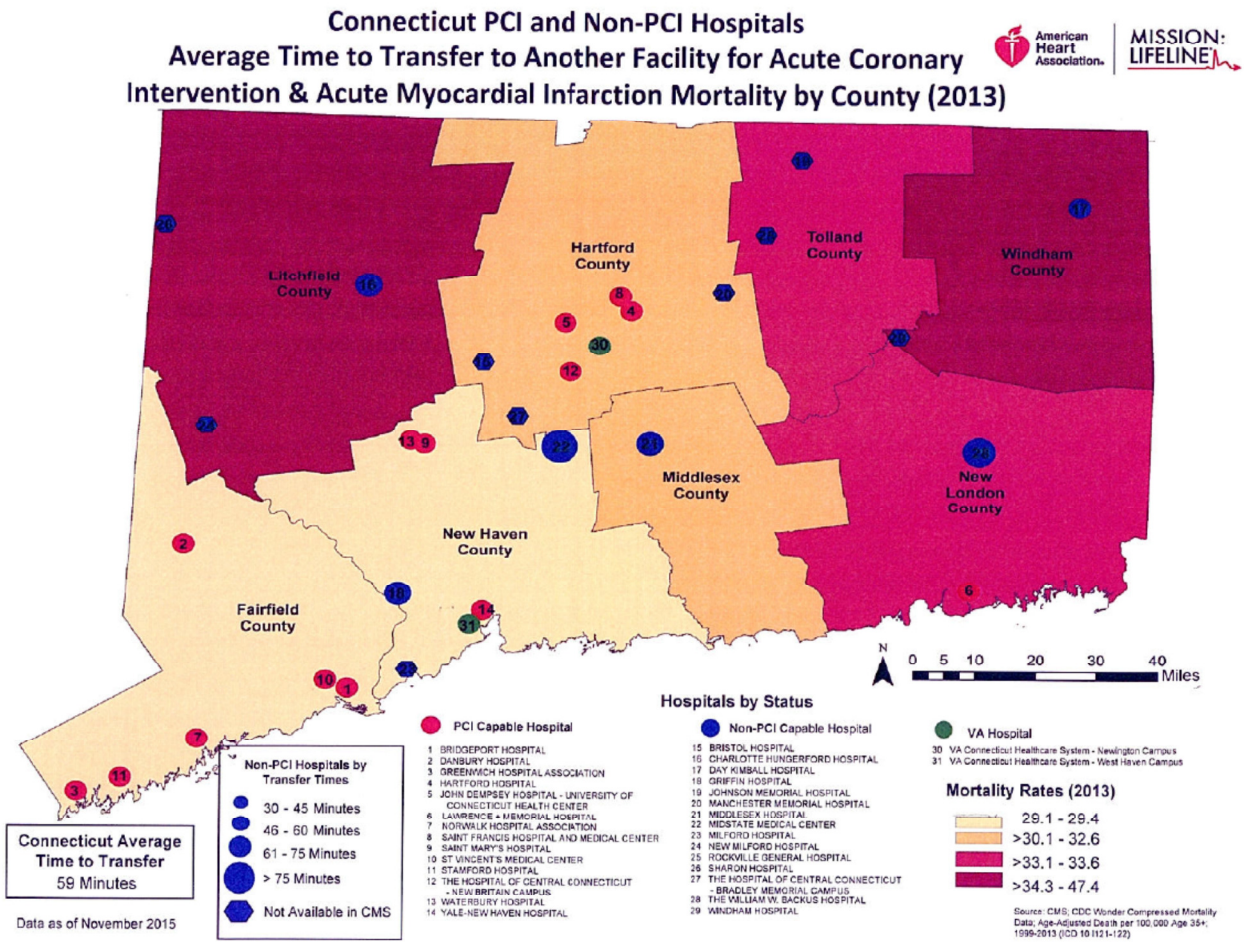
30 Minute Access to PCI-Capable Facilities



These facts are supported by The American Heart Association's 'Mission: LifeLine' data. Data as of November 2015 illustrate the drive time challenges faced by the Angioplasty Region.
The map below highlights 15 and 30 minute drive times from PCI capable hospitals. The majority of the Backus Angioplasty Region is outside a 15-30 minute drive time window.



'Mission: LifeLine' also analyzed the average time to transfer to another acute care facility for acute coronary intervention, and its impact on mortality. Backus Hospital, indicated on the map as having a greater than 75 minute transfer time, is located in a region with the third-highest mortality rate. This supports the argument that additional access is needed in New London County, as Lawrence + Memorial's program provides timely access to a limited population. Additionally, Windham County (which has no access to a PCI capable provider in Connecticut) has the highest mortality rate in the State at greater than 34.3-47.4 age adjusted deaths per 100,000. This mortality rate correlates with the map above. That is, areas outside of a 15-30 minute drive time (which mirrors the Angioplasty Region) have higher mortality rates. The establishment of a program at Backus Hospital will lower this mortality rate, and improve the access to this life saving standard of care to Eastern Connecticut residents.



Cost and safety factors. *As noted in the CON, the distances and travel times to a PCI facility can also be unmanageable or cost-prohibitive and thus, care is not sought. Within the Angioplasty Region, poor socioeconomics place further limits on residents. 43% of the Angioplasty Region has a median household income less than $50,000 per year, and fewer residents in the Backus Angioplasty Region have completed an undergraduate degree or post-graduate degree (26% vs. 36% and 29% in the State and Nation, respectively) (3d Health Assessment, p. 9-10 (CON, Exhibit 8, Pages 456-457). Patients who are transported from Backus to another facility for PCI must incur the expense associated with the transportation and duplication of services. It is estimated that a typical patient who is transported to another facility pays thousands of dollars in additional hospital expenses because of the transportation and duplication of services. These patients are also at increased risk of infections, bleeding complications, and other adverse events associated with multiple procedures at two facilities. Families of patients who are currently transferred face a financial burden as well due to costs of travel, parking and, at times, hotel accommodations, when the patient is admitted to the hospital. This clear service gap in PCI services for this region profoundly impacts patients and their families.*

Age, socioeconomic and health concerns. *As discussed more below, this is an area with a high and increasing demand for PCI services due to the aging population and poor health statistics and health status compared to state and national averages, yet as noted above, receive PCI interventions at a*

rate significantly below state and national levels. Residents of the Angioplasty Region also have a greater demand for cardiac services due to poorer cardiovascular health than the state and national averages as demonstrated by key statistics. They also have a high prevalence of key risk factors for coronary heart disease, including:

- *increased prevalence of high blood pressure (almost 36% of New London & Windham Counties compared to 31% for the state), diabetes, smoking, obesity, and physical inactivity - more than 85% of adults reported one or more risk factors (As found in the Hartford HeatlhCare's Eastern Region Community Health Needs Assessment, page 23 (CON, Exhibit 3, Page 153))*
- *high mortality and hospitalization rates for heart disease - between 2011 and 2013, the annual average age adjusted heart disease mortality rate was 167.5 deaths per 100,000 for Windham County versus 153.4 deaths per 100,000 for Connecticut*
- *low number of primary care physicians (an indication that residents are receiving insufficient preventative services) - 58.9/100,000 versus 84/100,000 statewide*
- *high rate of uninsured and underinsured*
- *low socioeconomic status*
- *high proportion of elderly residents which has large effect on the incidence of heart disease and the need for cardiac related services*

88.2% of individuals residing in Hartford HealthCare's Eastern Region (which includes the Angioplasty Region) have one or more cardiovascular risk factor (Hartford HeatlhCare's Eastern Region Community Health Needs Assessment, page 23 (CON, Exhibit 3, Page 155). The Burden of Cardiovascular Diseases in Connecticut ("BCVD"), cited previously in the CON (CON, Page 57), identifies two different categories for risk factors relating to cardiovascular diseases: modifiable and non-modifiable. Non-modifiable risk factors include indicators such as age and family history, whereas modifiable risk factors include such indicators as high blood pressure, high cholesterol, smoking, diabetes, obesity, and physical inactivity. As discussed in detail in the CON, the Angioplasty Region suffers disproportionately from all of these risk factors. The table below highlights specific risk factors and health outcomes for residents of Hartford HealthCare's Eastern Region, the Backus Hospital Service Area (which is the area most contiguous to Backus Hospital and includes towns from the Angioplasty Region), as compared to the State of Connecticut (Hartford HealthCare's Eastern Region, Community Health Needs Assessment CON, Exhibit 3, Page 155-162). An excerpt of the Backus Hospital Community Health Needs Assessment is included as ***Exhibit 28.*** *As demonstrated by the table, the Eastern Region and the Backus Service Area fares worse than the State across risk factors. The Backus Hospital Service Area has worse outcomes across most risk factors than the Eastern Region. These data illustrates the need for Backus Hospital to establish PCI services:*

Risk Factor	*Hartford HealthCare's Eastern Region*	*Backus Hospital Service Area*	*Connecticut*
% of Population with 1+ Cardiovascular Risk Factors	*85.1%*	*88.2%*	*No benchmark available*
% of Population with High Blood Pressure	*35.7%*	*39.5%*	*31.3%*
% of Population with High Cholesterol	*32.4%*	*31.7%*	*37.8%*
% of Population who are Current Smokers	*16.6%*	*18.9%*	*15.5%*
Diabetes Age Adjusted Death Rate	*15.8*	*16.4*	*14.8*
% of Population with Diabetes/High Blood Sugar	*11.0%*	*12.4%*	*11.7%*
% of Overweight Population (BMI 25+)	*66.2%*	*69.5%*	*62.6%*
% of Obese Population (BMI 30+)	*30.2%*	*32.4%*	*25%*
% of Population with no physical activity	*27.0%*	*28.5%*	*24.9%*
Diseases of the Heart Age Adjusted Death Rate	*165.7*	*169.0*	*153.4*
% of Population with Heart Disease (Heart Attack, Angina, Coronary Disease)	*5.9%*	*5.8%*	*No benchmark available*
*% of Population who experienced a heart attack**	*N/A*	*4.0*	*No benchmark available*

**Differences exist within the primary and secondary service areas of Backus Hospital. The Primary Service Area (the area most contiguous to Backus) has a higher prevalence of heart attack, with 5.5% of the population vs. 2.4% of the secondary service area.*

Based on the foregoing reasons, the need for PCI services in the Angioplasty Region is clear and evident - a void that this CON, if approved, will address. *As noted in the 2011 ACCF/AHA/SCAI Guideline for Percutaneous Coronary Intervention, "It is only appropriate to consider initiation of a PCI program without on-site cardiac surgical backup if this program will* ***clearly fill a void in the healthcare needs of the community****," (emphasis added) (CON, Exhibit 9) and further, in the 2014 ACC/SCAI Expert Consensus Document, "It behooves the cardiology community to foster [elective PCI without on-site surgery] programs…when such programs* ***improve access to a higher level of cardiovascular*** *care than would otherwise be available." (CON, Exhibit 1).*

3. To what percentage of the projected PCI patients associated with the proposal do the DPH Regulations on page 93 apply? Discuss in detail how the regulations apply to elective angioplasty patients and the relevance of a 30-minute drive time.

The DPH Regulations, (discussed in the CON on page 93), highlight the relationship of time with clinical outcomes in the case of patients requiring a PCI. These regulations set a standard of care for STEMI patients, who are identified in the field, to be transported to the closest PCI-capable facility, if there is one within a 30 minute drive time of the patient. The objective of these recommendations is to ensure, whenever possible, that the goal of a 90-minute door-to-balloon time is achieved. In the case of an Emergent PCI, time is muscle, and so a shorter transport time will likely reduce necrosis, ultimately improving patient outcomes. The Door-In-Door-Out and Door-to-

Balloon times for patients in the Angioplasty Region are outside acceptable windows. Thus, this is an indication that patients in the Angioplasty Region are not able to access the same high quality care available elsewhere in the State, as illustrated in the response to question 2. The establishment of a PCI program at Backus will fix this issue, improving access for all. In total, the establishment of a program at Backus will improve access to care for 6.4% of the State of Connecticut, and 59% of New London and Windham Counties.

In the case of non-Emergent, "Elective," PCI patients, time is still of the essence. Elective procedures are still time-sensitive, urgent, and necessary procedures. The guidelines aren't technically applicable to Elective patients, but the relevance of a 30 minute drive time will improve access to patients' ability to access services. Two scenarios are currently at play for patients requiring a non-Emergent PCI who reside within the Backus Hospital Angioplasty Region:

Patients must leave the service area for care. *Patients who undergo an Elective PCI have risk factors, or test results which show that if a PCI to correct the blockages causing the ischemia is not performed, the patient would be more likely to have a fatal myocardial infarction in the future. Unlike primary PCI, this procedure is scheduled, but ideally takes place within 24-48 hours of diagnosis to effectively reduce the risk of future cardiac events. Once these patients have their coronary intervention, their reoccurring symptoms are alleviated and they are able to return to their baseline health. The closest provider of this service today is Lawrence + Memorial Hospital, located in New London, Connecticut. Lawrence + Memorial however, is more than 45 minutes away from North Eastern Connecticut communities. For example, Lawrence + Memorial is 47 minutes from Brooklyn, Connecticut, more than 35 minutes away from Plainfield, Connecticut, and almost 40 minutes from Windham. This drive time, coupled with the socioeconomic factors of these communities, makes seeking care even 40 minutes away burdensome. If Backus is approved to establish a PCI program in Norwich, drive times would be cut in half; Brooklyn would be able to access services within 28 minutes, Plainfield within 17, and Windham residents within 20. These improved drive times not only benefit Primary PCI patients, but provide access to care close to home for Elective patients as well.*

Patients are transported via EMS from Backus Hospital's Catheterization Lab to a PCI facility. *Backus Hospital operates a diagnostic catheterization laboratory in Norwich. In Fiscal year 2015, 234 diagnostic catheterizations were performed at Backus. Often, patients who are undergoing a diagnostic procedure have an identified occlusion requiring a PCI. These patients are then transferred from Backus to a PCI capable facility via EMS. These patients then undergo a repeat catheterization to clear the blockages found in the initial procedure. Often this requires another groin or radial puncture to the patient. By having an elective PCI program at Backus patients will be able to have the diagnostic and elective procedure completed together, reducing the exposure to radiation and intravenous contrast used during the procedure. This will also reduce the burden placed on family members who must meet their loved one in an unfamiliar facility and city in an already stressful situation. These patients are choosing Backus for their care, but are unable to receive standard cardiovascular care as residents elsewhere in the State and in the Nation.*

The DPH regulations are only technically applicable to Primary PCI patient transports. This represents 79, or 36.5%, of projected patients in Year 1 of the program, a significant proportion of estimated volume. The establishment of a program at Backus, however, will improve care for all.

4. <u>Using the service area defined in the table below,</u> update FY 2015 numbers through the end of the fiscal year for the tables on pages 46, 62, 101 102, 103 and 104. If full year data is unavailable, update the 2015 numbers through the most recent month available and identify that month.

The table below shows inpatient PCI discharges from Backus Hospital's primary services area+ towns:

	PCI Hospital						
Primary Service Area Patient Towns	Yale	Hartford	L&M	St. Francis	John Dempsey	Central CT	**Total**
Canterbury	<6	<6					**<6**
Colchester	<6	12		<6			**14**

*ICD-9-CM Procedure Codes: .66, 36.01, 36.02, 36.05, 36.06, 36.07 & 36.09

Please note: unduplicated counts utilizing all procedure codes

+Primary service area towns make up the top 75% of a hospital inpatient discharges.

Cells sizes less than six are masked for patient confidentiality

The OHCA-defined primary service area definition for Backus Hospital, while consistent with most methodologies in defining a hospital's primary market as 75% of patients, is not contiguous and is absent consideration for patient travel times, which are critical for a PCI program.

Six towns (Gales Ferry, Ledyard, Mashantucket, Montville, Oakdale, and Uncasville) were excluded from the 3d Health-defined Backus Angioplasty Region due to their proximity being closer to Lawrence + Memorial. Even though those towns are also within a 30 minute drive-time to Backus Hospital and account for 11% of Backus' current inpatient origin, those PCI patients should receive more timely care at Lawrence + Memorial.

One town, Plainville, is considerably closer to Hartford Hospital. Backus Hospital only received two inpatients from that market in 2015.

Of the remaining towns included in the Angioplasty Region, all are either within a 30 minute drive-time and closest to Backus Hospital or currently have no access to a PCI facility within a 30 minute drive-time and are within a 45 minute drive-time to Backus Hospital.

Please see the detailed patient origin analysis, below, for more information. This table compares and contrasts the OHCA-defined service area with the Backus Angioplasty Region, and the traditional CMS Stark Defined Service Area. It provides, by town, the percentage of total Backus inpatient discharges as well as the Backus market share within each region. Finally, this table provides notes on why each city was either included or excluded from the Backus Angioplasty Region:

The updated tables with the OHCA defined service area are listed below. Additionally, some tables reflective of the entire Angioplasty Region were updated with complete FY2015 numbers.

Page 46 (revised to reflect only the OHCA defined service area and to include all Hospitals listed in OHCA's table, above. Includes the town of Plainville, as requested by OHCA.)

Facilities Providing PCI to the OHCA-Defined Service Area

FY 2015 Data	Hartford Hospital	John Dempsey Hospital	Lawrence + Memorial Hospital	Saint Francis Hospital	The Hospital of Central Connecticut	UMass Memorial - University	Yale-New Haven Hospital
Service Area Cases / Market Share: **Primary PCI**	14 cases / 19% share	0 cases / 0% share	28 cases / 36% share	4 cases / 5% share	10 cases / 13% share	5 cases / 6% share	12 cases / 16% share
Service Area Cases / Market Share: **Elective PCI**	36 cases / 12% share	30 cases / 10% share	23 cases / 7% share	20 cases / 6% share	5 cases / 2% share	49 cases / 16% share	133 cases / 43% share
Total Estimated Primary PCI Cases	476 cases	177 cases	121 cases	369 cases	70 cases	347 cases	635 cases
Total Estimated Elective PCI Cases	623 cases	222 cases	95 cases	415 cases	15 cases	~753 cases (OP estimated)	940 cases
Total Coronary Angioplasty (inpatient and outpatient)[2]	1,099 cases	399 cases	216 cases	784 cases	85 cases	~1,100 cases (OP estimated)	1,575 cases
Percent of all Hospital's Coronary Angioplasty (Primary + Elective) from the Service Area	4.5%	7.4%	23.6%	3.0%	17.6%	4.9%	9.2%

[1]UMass-University data from FY 2012; 33% of all elective estimated to be performed on an outpatient basis
[2]L&M data from OCHA filing
[3]Hartford data obtained directly
[4]YNNH, and St. Francis data per the CHA's Patient Census Report from October 2014 through September 2015

The OHCA-defined service area accounts for a small percentage of each provider's overall volumes, with the exception of Lawrence + Memorial. This is to be expected, however, as the towns of Gales Ferry, Ledyard, Mashantucket, Montville, Oakdale, and Uncasville are within closer proximity to Lawrence + Memorial, and have significant PCI volumes. These towns were excluded from Angioplasty Region, and their volumes were not included in the projections for the Backus program.

Page 62

Backus Hospital Diagnostic Catheterization Volume and Related Transfers Fiscal Year 2015			
Fiscal Year	***Total Volume***	***Angioplasty Region Volume***	***OHCA Defined Service Area Volume***

	Total	Transfers	% Transferred	Total	Transfers	% Transferred	Total	Transfers	% Transferred
2015 (10/1/14-9/30/15)	234	50	21.36%	208	44	21.15%	185	41	22.16%
% of Total				89%			79%		

Overall, diagnostic catheterizations have increased over 2014 by 16 procedures. This analysis indicates that the individuals residing in the Angioplasty Region account for 89% of the total diagnostic volume. This is interpreted to mean that residents of the Angioplasty Region, although outside of the OHCA defined service area, are choosing to receive their cardiac care at Backus. Further, the OHCA defined service area accounts for 79% of Backus diagnostic catheterization volume.

Total		***50***

PCI volume at Hartford Hospital from the Angioplasty Service Area held constant from FY 2014-2015. The OHCA defined service area accounts for 50 cases performed at Hartford Hospital in FY 2015. This is to be expected, as referenced in the response above, some towns in the OHCA defined region are better served by other institutions, such as Lawrence + Memorial, Hartford of Central Connecticut, or John Dempsey, due to the proximity of the patient's origin to the PCI capable facility.

Data for physicians 1-7 obtained directly, provided by internal data analytics. Reflective of Hartford Hospital volume only.
^Physician 8 data obtained directly and reflects 6 months of data not included in original CON application; data not available by zip code

Providers participating in the program are high volume operators, seasoned and high quality physicians. These physicians will provide the clinical oversight to any new providers entering the program, as they will all rotate through Hartford Hospital catheterization labs. This will ensure quality standards are met and sustained, and clinical outcomes are tracked.

Total	***163***	***165***	***167***

The methodology utilized to create the projected PCI volume was done on a regional level, not on a zip-code specific analysis. This is due to the variability in zip-code level volume, and the inability to

create reliable trend patterns. Therefore, to estimate future demand for PCI among service area residents, 3d Health prepared market projections based on a set of utilization rates applied to the service area population. To estimate what the projected volume at Backus Hospital would be for inpatient and outpatient primary and elective PCI from the OHCA-defined service area, 3d Health compared volume from the Backus Angioplasty Region with OHCA's definition. See the Tables below, which is based on CHIME data from October 1 – June 30, 2015:

Town	*3d Health-Defined Service Area*	*OCHA-Defined Service Area*
Bozrah	*2*

Total	***125***	***94***

The OCHA-defined service area differs significantly from the Backus Angioplasty region. The towns of Ledyard, Plainville, and Montville are included in the OHCA service area, while it omits towns contiguous to Norwich as well in Northern Windham County. What the analysis illustrates, however, is that the OHCA defined service area captured about 75.2% of the Angioplasty Region volume. This, coupled with OHCA's calculation that this definition captured about 75% of Backus' inpatient discharges, leads the analysis to assume that 75.2% of the projected Backus volume illustrated on page 104 of the CON and on page 43 of the 3d Health Assessment (CON, Exhibit 8, Page 490) could originate from this service area. These numbers are reflected in the Table above.

5. Explain the decreases in the number of diagnostic catheterizations and transfers reflected on Figure 20 on page 62.

The decrease in the number of diagnostic catheterizations is multi-factorial. Backus had catheterization providers relocate to other jobs outside of the State or service area throughout the

previous three fiscal years. When these relocations occurred, the local cardiology practices had a shortage of catheterization providers. This physician shortage meant that patients requiring diagnostic catheterization services were referred to other facilities, outside of the Angioplasty Region, where the referring provider had professional relationships.

Recent physician recruitments (through Hartford HealthCare Medical Group as well as the private physician groups in the community) have resulted in an improvement in volumes at Backus from FY 2014 – FY 2015.

6. Given that Yale, Hartford and L+M are the PCI providers listed on page 46, as well as St. Francis, John Dempsey and Central CT shown in the table above also serve Backus' service area patients, explain:

a. Why the proposal is not an unnecessary duplication of existing health care services currently available;

These providers are all outside the defined Angioplasty Region, and none of them are located in the service area defined by OHCA, above, or in a contiguous town or zip code to this service area. Therefore, there is no duplication of services within the defined Angioplasty Region.

As illustrated previously, residents in this region are forced to travel far distances to receive this life-saving standard of care, and have a higher mortality because of it. Lawrence + Memorial, the closest provider of PCI services to the Region, is not treating most of the patients originating from the Angioplasty Region today. In FY 15, only 32 patients were treated from patients originating from this geography. 30 of the 32 patients live within 30 minutes of Backus Hospital. Additionally, 17 of the 26 towns within the Angioplasty Region had no PCI patients served by Lawrence + Memorial in FY 15. The majority of cases are leaving the community altogether, seeking care at The University of Massachusetts ("UMASS"), Yale, or Hartford Hospitals, all high volume providers.

b. How the proposal will not result in a shift in volumes from existing providers; and
c. How there will be no impact on existing provider.

The 3d Health Assessment (CON, Exhibit 8, Page 447) revealed that a majority of cases originating in the Angioplasty Region are being treated out of the area for Primary and Elective PCI to high-volume providers. In 2014, 48% of Primary cases were transferred to Hartford, and 11% of transfers went to Yale-New Haven Hospital ("YNHH") (3d Health Assessment, p. 22 (CON, Exhibit 8, Page 469). While Hartford captured the greatest share of Primary PCIs, YNHH captured the greatest share of Elective PCIs (3d Health Assessment, p. 23 (CON, Exhibit 8, Page 470)). YNHH is a full-service cardiac provider and like Hartford Hospital has one of the busiest cardiac catheterization laboratories in the State of Connecticut. The majority of the remaining Primary and Elective PCI market is split between UMASS, Lawrence + Memorial, and St. Francis Hospital. In FY 2012, 137 total cases went to UMASS, and in FY2014 22 cases from the Backus market went to Lawrence + Memorial, and 45 cases went to St. Francis (3d Health Assessment, p. 32 (CON, Exhibit 8, Page 479). John Dempsey and the Hospital of Central Connecticut are not treating patients from the Region due to the distance from the market. All of

these programs meet or exceed facility minimums each year, per the recommended guidelines, and the patient volume originating from the Backus market seeking care at these institutions is small enough to ensure that establishing a PCI program at Backus will not compromise the strength of the programs in existence at any of these providers. See the table below for more detailed information.

As stated in the response to question 4, above, multiple towns were excluded from the Backus Angioplasty Region as they are in closer proximity to Lawrence + Memorial; in a cardiac emergency such as the onset of a STEMI time is muscle. These patients are better served by seeking care at Lawrence + Memorial. Additionally, the town of Plainville is not within a close drive time to Backus, and Backus Hospital only received 2 inpatient discharges from Plainville in FY 2015. This town has been excluded from the analysis in the chart below.

This chart highlights the potential impact to other angioplasty providers as identified by OHCA. It assumes that all volume from the Angioplasty Region currently seeking care at Hartford Hospital would transfer to Backus, given that Backus would be the closest PCI provider to these communities. It also assumes that 36% (the overall Backus inpatient market share of the entire Angioplasty Region) of the volume currently cared for at other PCI providers would shift to Backus. This assumption is based on historical trends instead of use rates based on population size, disease burden, and demographics (a more reliable and accurate methodology for calculating potential volume). It therefore does not tie completely with the actual anticipated projected volume as shown on page 70 of the CON application and page 43 of the 3d Health Assessment (CON, Exhibit 8, Page 490), however it does come very close (only different by 6 cases).

Further, it does not back out the elective volume that would continue to seek care at Lawrence + Memorial based on patient choice and physician referral.

Ultimately, however, this analysis shows that although volume will shift from other institutions, ***it will not compromise*** *any of the existing programs in the State. It will, however, provide optimal patient access and bring a standard of care to a currently underserved market.*

Projected Angioplasty Region PCI Volume Shift to Backus

FY 2015 Data	Backus Angioplasty Region PCI Cases	Total Hospital PCI Cases	% of PCI Cases from the Backus Angioplasty Region	Backus Angioplasty Region IP Market Share	Projected PCI Volume Shift to Backus Hospital	Remaining Hospital PCI Volume
Hartford Hospital	135	1,099	12.3%	100%	135	964
John Dempsey Hospital	0	399	0.0%	36%	0	399
Lawrence & Memorial Hospital	32	216	14.8%		12	204
Saint Francis Hospital	53	784	6.7%		8	776

[2]L&M data from OCHA filing
[3]Hartford data obtained directly
[4]YNNH, and St. Francis data per the CHA's Patient Census Report from October 2014 through September 2015

**Please note: The volumes reflected above are derived from the Angioplasty Region, as defined on page 4 of the 3d Health Assessment (CON, Exhibit 8, Page 451)*

7. Discuss and describe the existing referral base (physicians and physician practices, specifically the interventionalists) in the service area defined in the table above.

There is no referral base for Primary PCIs – these are emergency cases and are brought in through the EMS network, based on DPH guidelines and medical oversight. Additionally, Backus does not have a PCI program, so is not receiving referrals for elective procedures today.

Within the OHCA-definition of the market, there are three cardiology groups practicing at Backus. These practices include the Yale Medical Group, Norwich Cardiac Medicine, and Hartford HealthCare Medical Group. Two interventionalists currently have privileges at Backus to work in its diagnostic catheterization lab. In total, these practices employ 16 physicians.

Upon approval of the program, Hartford HealthCare Medical Group will recruit another interventionalist to work at Backus under the clinical oversight of Hartford Hospital. This interventionalist will also rotate through Hartford Hospital's catheterization lab to ensure adherence to clinical standards, and operator minimums are met and sustained.

Extending access to subspecialty experts across Hartford HealthCare is the mission for HHC's evolving Cardiovascular Institute. The Institute's care delivery model supports standardization of care, appropriate use of resources, and a collaborative team approach to ensure the patient receives comprehensive care within their community. Extending services to Backus under the Institute model supports the aforementioned goals and ensures quality is achieved through aligning providers with quality expectations under the direction of high volume operators. The program will be supported through the Institutes quality and leadership team, maintaining and growing services valuable to

patients within the HHC system. The practicing clinicians are all aligned with the Institute's strategic goals and objectives and support the extension of PCI services in a streamlined and effective manner.

Additionally, Backus Hospital has support from Day Kimball Hospital for establishment of the program. Day Kimball does not employ interventionalists, but does require a Connecticut option for patients requiring an Elective PCI. Day Kimball believes establishing a program at Backus will improve door-to-balloon times for patients originating from the northeast corner of the Angioplasty region.

8. Page 25 indicates physician alignment requirements have been met. Explain what the alignment is at Backus Hospital and its impact on the proposed services.

Hartford Hospital is a regional provider for cardiovascular services, and through the establishment of a Primary and Elective PCI program at Backus, will be able to provide consistent coverage for the program, standardize practice and ensure quality of care in accordance with Hartford Hospital standards. Hartford Hospital will have the ability to work collaboratively with both employed and independent providers in developing the program; the benefit of such an affiliation is to provide patients in the Backus Angioplasty Region with access not only to PCI services, but to expertise in subspecialty areas, surgical expertise from Hartford Hospital in a market that has no providers of open heart surgical services, and an ability to access, and participate in, an established quality program to standardize practice and monitor key core measures and outcomes.

Backus and Hartford Hospital have support from physician partners (as illustrated by letters previously submitted) to establish the program. Currently, these physicians are independent, tightly aligned, or employed by the Hartford HealthCare Medical Group. Physicians participating in the program will rotate through Hartford Hospital's catheterization lab, ensuring all clinical and volume standards are met or exceeded. Any new providers hired into the program will be incorporated into a medical group of high volume providers, given the requirements of the HHC Institute Care Delivery Model. These clinicians will benefit from the expertise and experience of the seasoned team practicing in the Hartford Hospital catheterization labs, and will be a part of the ongoing rotation to ensure regulatory standards and volume targets are achieved. This alignment will further Hartford HealthCare's journey towards achieving one registration, one health record, one standard of excellence, one bill, and one relationship.

9. Describe in detail the proposed on-call system with physicians at Hartford Hospital and Hartford Cardiac Laboratory, P.C. and Dr. John Michael Chua Chiaco to ensure continuous 24/7 coverage.

See response to question 10, below.

10. Provide a copy of the on-call schedule for the physicians that will provide coverage for the proposed program.

Until the program is approved by OHCA a detailed on-call system for the Backus program will not exist. Once approved, however, the on-call system will mirror that which currently exists at Hartford Hospital. A sample on-call schedule for the PCI program at Hartford Hospital is attached as ***Exhibit***

29 for illustrative purposes). All physicians participating in the program, however, will be part of a general call pool made up of high volume physicians. As stated to the answer to question 8, above, any new physicians hired as part of the program will practice at Hartford Hospital, ensuring seasoned provider oversight and adherence to standard quality guidelines.

11. In a table format, provide angioplasty volumes, separated by primary and elective procedures, for each of the physicians in the proposed program for the most recent full fiscal year, and indicate the year.

Fiscal Year 2015	*Primary*	*Elective*	*TOTAL*

TOTAL HH	***469***	***513***	***1,155***

Data for physicians 1-7 obtained directly, provided by internal data analytics; Reflective of Hartford Hospital PCI volume only

^Physician 8 data obtained directly, reflects 6 months of data not included in original CON application; data not available by zip code

12. Table 6 on page 78 shows a projected 2% increase in PCIs from FY16 to FY18. Please elaborate on the assumptions used to arrive at the growth rate.

The projected Backus Hospital PCI volume shown in Table 6 on page 78 is calculated by applying Backus Hospital's historic market share and immigration rates to the projected service area volumes as shown on pages 42 and 43 of the 3d Health Assessment (CON, Exhibit 8, Pages 489-490). Since the typical Primary PCI patient presents at a hospital emergency department ("ED"), 3d Health applied Backus and Windham combined FY 2014 ED market share to the projections to estimate the potential for Primary PCI cases at Backus. Market share was calculated for each specific geographic region within the defined service area, based on 30 minute drive time from Backus. For those cases from towns within 30 minutes of Backus, 80% was applied to the total potential Primary PCI volume (the combined market share for Backus and Windham). For those cases from service area towns outside of 30 minutes away from Backus, 11% was applied to total potential volume Primary PCI volume (the combined market share for Backus and Windham). An immigration rate of 5.4% was applied, based on the historic emergency department experience (the combined immigration rate for Backus and Windham). In estimating Backus Hospital's Elective PCI volumes, "complex" Elective PCI cases (those with a history of previous cardiac event or intervention) were removed from the total potential Backus case volume, assuming that these patients would require care at a tertiary institution offering on-site cardiac surgical backup and would not receive their elective angioplasty at Backus. Backus Hospital inpatient market share for each town within the defined Backus service area (based on the 10, 10-30, and 30+ drive times) was applied to the remaining potential service area volume (75% of cases originating 10 minutes from Backus, 50% of

cases originating 10-30 minutes from Backus, and 25% of cases originating 30+ minutes from Backus). An immigration rate of 3.2% was applied, based on the historic Backus Hospital inpatient experience. The number of Elective PCI Lawrence + Memorial cases from patients originating from the Backus Service Area was projected based on historic OCHA data and removed from the potential Backus volume under the assumption that these cases would continue to be performed at Lawrence + Memorial. Thus, the 2% projected growth in Backus Hospital volume is a result of applying a constant market share to a growing number of service area cases.

13. On page 459, PCIs are defined to include ICD-9 CM procedure code 17.55 and NSTEMIs to include ICD-9-CM diagnoses codes 426.2 – 426.3. Explain each inclusion and provide a source/citation.

PCIs were defined to include ICD-9 CM procedure code 17.55 per the Connecticut Department of Public Health (http://www.ct.gov/dph/lib/dph/hems/chronic_dis/hospitaldata/cdi13web.pdf).

NSTEMIs were defined to include diagnosis codes 410.7x in any of the first ten positions. The use of diagnosis codes 426.2 and 426.3 were only to further classify patients as Left Bundle Branch Block if they had already been defined as an NSTEMI patient.

14. Revise and resubmit the payer mix table on page 79 as the rows appear to have shifted downward and are not correctly aligned. In addition, provide the assumptions used for the projected population mix.

Page 79, Table 7: Applicant's Current & Projected Payor Mix

****Volume reflects both IP & OP, incremental volume projections***

3d Health calculated a payor-weighted reimbursement by DRG based on the payor mix of all PCI patients originating the Backus service area.

15. Page 67 indicates a capital expenditure of $4.8 M for an additional cath lab, software and equipment update and allowances for ongoing capital needs. Page 62 shows a 32% decline in cardiac caths between 2012 and 2014. Explain the need for an additional cath lab.

STEMI patients requiring PCI experience the best clinical outcomes when the procedure is performed within 90 minutes from first medical contact. In order to achieve these results Backus must be able to have a procedure room ready to accept these patients at all times. During normal business hours of 7am-4pm the existing catheterization laboratory is utilized for diagnostic catheterizations and electrophysiology procedures such as pacemaker and ICD insertions. These procedures can range from 45 minutes to three hours. Waiting for an available room costs a STEMI patient heart muscle and does not result in optimal outcomes. A second room allows Backus to schedule diagnostic and electrophysiology patients in such a way that there will always be a room available within 30 minutes of a STEMI arrival to Backus. This will ensure Backus routinely meets the 90 minute door-to-balloon time recommendation from the 2014 AHA/ACC/SCAI STEMI guidelines.

Additionally, the second catheterization lab is investment in the total cardiovascular service line at Backus Hospital. As mentioned previously, electrophysiology procedures are performed in a catheterization lab. Adding a second room at Backus will allow that subservice line to grow, better meeting the demands of the community.

Finally, this second room, coupled with the establishment of PCI services at Backus, creates redundancy within the Hartford HealthCare system of care. Hartford Hospital's catheterization labs are at capacity, as demonstrated on page 35 of the 3d Health Assessment (CON, Exhibit 8, Page 482). The evolution of a Cardiovascular Institute at Hartford Health Care requires the System to leverage resources across the continuum of care. The addition of capacity (programmatic and physical plant) at Backus provides the care delivery system with the ability to manage complex, acute, and elective procedures across all Hartford HealthCare hospitals in a cost effective manner. In addition, 75% of the catheterization labs at Hartford Hospital have reached the end of useful life, requiring imaging upgrades in order to maintain quality and safety standards. With these labs being offline in 2016, having the ability to support access to care with a consistent team of physician experts, through the addition of a lab and program at Backus, will ensure timely care delivery and a consistent standard of care.

Establishing a program, and additional rooms, at Backus Hospital will allow for decompression of the Hartford lab in the case of planned or emergency maintenance or upgrades, or in times of high patient need.

16. Confirm the projection of 385 PCIs in year 5 in order to achieve operating gains.

3d Health reassessed the number of PCIs needed in year five to achieve operating gains and determined that the projection of 385 was off by four procedures. The confirmed number of PCIs needed in year five to achieve operating gains is 381.

This is based on a very conservative financial model that includes an annual inflation rate of 2.68%. If the annual inflation rate were set to zero, the number of PCIs needed in year five to achieve operating gains would be 277.

EXHIBIT 28

Summary Report

2015 Community Health Needs Assessment

Backus Hospital Service Area

Prepared for:
Backus Hospital

Summary Tables: Comparisons With Benchmark Data

The following tables provide an overview of indicators in the Backus Hospital Service Area. These data are grouped to correspond with the Focus Areas presented in Healthy People 2020.

Reading the Data Summary Tables

In the following charts, Backus Hospital Service Area results are shown in the larger, blue column.

The green columns [to the left of the BHSA column] provide comparisons among the two subareas, identifying differences for each as "better than" (☼), "worse than" (☁), or "similar to" (⛅) the opposing area.

The columns to the right of the service area column provide comparisons between local data and any available state and national findings, and Healthy People 2020 targets. Again, symbols indicate whether the Backus Hospital Service Area compares favorably (☼), unfavorably (☁), or comparably (⛅) to these external data.

Note that blank table cells signify that data are not available or are not reliable for that area and/or for that indicator.

Overall Health	PSA vs. SSA: PSA	PSA vs. SSA: SSA	BHSA	BHSA vs. Benchmarks: vs. CT	BHSA vs. Benchmarks: vs. US	BHSA vs. Benchmarks: vs. HP2020

Re: Docket No. 15-32031-CON – Supplemental Letter of Support

Dear Ms. Martone:

On behalf of Hartford Hospital and The William W. Backus Hospital, attached please find one additional Letter of Support (from NorthEastern Connecticut Cardiology Associates, PC) for the Applicants' Certificate of Need Application to establish and operate a Primary and Elective Angioplasty Program at Backus Hospital.

Please do not hesitate to contact me if you have any questions.

Very truly yours,

BROWN RUDNICK LLP

David A. Whitehead
President
The William W. Backus Hospital
326 Washington Street
Norwich, Connecticut, 06360

Dear Mr. Whitehead,

Please accept this letter of support for the development of a Primary and Elective Percutaneous Cardiac Intervention (PCI) program at The William W. Backus Hospital.

A program of this kind is sorely needed in the northern New London and Windham counties, enabling Eastern Connecticut residents to have timely access to PCI. Many residents of this region are currently unable to access a PCI-capable facility within a 30-minute drive time, or within their local communities. This lack of access is a barrier to receiving what is considered to be the standard of care for a life-limiting heart condition.

As a local provider, I am convinced of the need to have this level of care available in our community – our families, friends and neighbors should not be at a disadvantage when it comes to their health, just because of where they live. Having the clinical and technological infrastructure available at Backus, coupled with its strong relationship with Hartford Hospital, will result in optimal care for cardiac patients in need of PCI.

Please accept this letter of support – Backus should be commended for its commitment to offering Percutaneous Cardiac Intervention, close to home for patients.

Sincerely,

William Bradbury MD, FACC

Hearing Officer Hansted,

My name is Greg Allard and I am the Vice President of American Ambulance Service, Inc. (AASI) located in Norwich, Connecticut. American serves not only Norwich (with a population of over 40,000); we serve 22 communities in Eastern Connecticut including the Mashantucket Pequot Tribal Nation. In addition to all of our emergency responsibilities, we provide non-emergency or routine ambulance and wheelchair transportation. We work closely with all of our community hospitals and skilled nursing and rehab facilities.

Support for a PCI Program at Backus

As the major EMS provider in the defined Backus Hospital Angioplasty Region, AASI fully supports the CON application to provide Primary and Elective PCI at Backus. The reason for our support is two-fold. Most importantly, we believe having such a program is in the best interest of all of the residents in the community we serve and our patients are always our number one priority. Secondly, it will create efficiencies within our system that have the potential to improve our availability to respond to emergency and non-emergency requests and this is due to the fact that our ambulances will remain in our primary service area longer.

Some STEMI patients can be identified in the field via an EKG performed in the out of hospital arena, however this can only occur if a Paramedic is on-board, either at the time of patient pick up or through an "intercept" en route to the hospital. In the defined Angioplasty Region three EMS providers have Advanced Life Support (ALS) abilities. In total, these EMS providers can staff 17 Paramedic vehicles, on average; there are 14 available ALS vehicles during the day, and 7 during the night.

AMERICAN AMBULANCE SERVICE, INC.

ONE AMERICAN WAY
NORWICH, CONNECTICUT 06360
860.886.1463 (V)
860.887.1138 (F)
americanamb.com

Throughout the region there are many volunteer-based ambulance services that are Basic Life Support (BLS) capable and are not qualified to determine if a patient is experiencing a STEMI when picked up in the field. Thus, the potential exists for patients with unidentified STEMIs to arrive at Backus Hospital in need of Primary PCI if a Paramedic is not available.

Patients receiving diagnostic catheterizations that require Elective PCI also require transport via EMS to PCI-equipped facilities. Currently there is only one of those facilities in Eastern Connecticut and there are at least a dozen in the western half of Connecticut. Therefore, residents living in the Angioplasty Region must travel, by ambulance, significant distances for this life saving procedure.
Studies have proven that time is of the essence when dealing with STEMI patients in order to ensure the best possible health outcomes. So both Primary and Elective PCI can necessitate transport via EMS to a PCI-capable facility. As any commuter can tell you, travel times are highly dependent on weather conditions, traffic patterns and road work/construction as well as accidents. So the transfer times between facilities can vary greatly.

Additionally, on page 1449 of the Backus/Hartford Hospital Completeness Responses there is very valuable data provided by the American Heart Association's Mission: LifeLine that shows the Backus Hospital Angioplasty Region has: an average 75 minute transfer time for acute coronary intervention in New London County which has the third-highest mortality rate and, more importantly, it also includes Windham County (which has no access to a PCI capable provider in Connecticut) and it has the highest mortality rate in the State. A PCI program in Backus Hospital would therefore improve the timeliness of accessing critical, life-saving procedures.

AMERICAN AMBULANCE SERVICE, INC.

ONE AMERICAN WAY
NORWICH, CONNECTICUT 06360

americanamb.com

Conclusion

For the reasons stated above, we at American Ambulance Service, Inc. urge the Office of Health Care Access to approve the William W. Backus Hospitals' request for PCI services.

Respectfully,

Gregory B. Allard, Vice President

Dedicated, Professional People Committed to Excellence, Caring for You.

Irene Cardinal
11 Prentice Street
Taftville, CT 06380

March 16, 2016

To whom it may concern:

My name is Irene Cardinal. I'm 55 years old and live in Taftville, Connecticut.

In the early morning of February 4 of this year I came to the Backus Hospital Emergency Department after experiencing a fever and elevated heart rate. While I had been diagnosed with an irregular heart beat in the past and do have slight high blood pressure from time to time, I have no other preexisting conditions that would have led me to believe that I was having a serious problem with my heart; I'm not a drinker or a smoker and I don't have diabetes. But in hindsight, I think the signs were all there.

After two blood tests came back negative, the cardiologist on-call—Dr. Amr Atef—ordered a stress test for me later that morning after my heart rate was normalized and I was admitted to the hospital. When the third blood test came back positive, (right before I got on the treadmill actually), Dr. Atef cancelled the stress test, ordered an echocardiogram and discussed the importance of an angiogram with me. He sent me to rest, eat, started some heart medications and scheduled the angiogram for the next morning. The angiogram done at Backus Hospital showed I had two blockages—one at 95 percent. I was to be transferred immediately to Hartford Hospital for angioplasty.

This all happened so quickly and my head was spinning. When I entered the hospital the day before, I thought at worst I'd be prescribed medicine for my racing heart. Now, I was being sent to Hartford Hospital for what could be a lifesaving procedure.

To make matters worse for me and my family, Connecticut was in the middle of a winter storm as nearly a foot of snow was falling across parts of the state. The ambulance crew that transported me was amazing but the trip through the storm was harrowing at best. The roads were a disaster, some stretches were unplowed, and we got stuck behind an accident for more than 20 minutes. I could hear the slush and snow crunching under the vehicle as we navigated the shoulder to drive past the crash. The 40 mile trip took more than two hours.

As you can imagine, the situation was also quite stressful for my husband. Not only was his wife having an unexpected medical emergency, but now, because of the storm, he couldn't make it to the hospital to be there for me during my procedure.

My procedure at Hartford Hospital was a success. I'm currently undergoing follow up care to determine what should be or needs to be done for the second lesser blockage. There's been no talk of having to go back to Hartford for any more procedures and I am hoping/praying none will

Live to Barbara

be necessary. My care at both Backus and Hartford Hospital was and continues to be exemplary. However, having to be transported for care during a snowstorm made a stressful event even more stressful for me and my family. I wouldn't want another person to have to go through that. Having angioplasty available at Backus Hospital would mean community members could rest easier knowing that lifesaving cardiac care is available close to home if and when they need it.

Sincerely,

Irene Cardinal

RE: Certificate of Need Application, Docket Number 15-32031-CON
The William W. Backus Hospital
Establishment of a Primary and Elective PCI Program at The William W. Backus Hospital

Dear Ms. Edwards,

With the receipt of the completed Certificate of Need ("CON") application information submitted by The William W. Backus Hospital ("Applicant") on January 29, 2016, the Office of Health Care Access ("OHCA") has initiated its review of the CON application identified above.

Pursuant to General Statutes § 19a-639a (f), OHCA may hold a hearing with respect to any Certificate of Need application.

This hearing notice is being issued pursuant to General Statutes § 19a-639a (f)

Applicant:	The William W. Backus Hospital
Docket Number:	15-32031-CON
Proposal:	Establishment of a Primary and Elective PCI Program at The William W. Backus Hospital

VS. : **AT PUTNAM**

THE HEIRS, BENEFICIARIES, REPRESENTATIVES AND CREDITORS OF THE ESTATE OF ANN-MARIE KENYON, ET AL :**JANUARY 18, 2016**

ORDER OF NOTICE

NOTICE TO: **THE HEIRS, BENEFICIARIES, REPRESENTATIVES AND CREDITORS OF THE ESTATE OF ANN-MARIE KENYON**

The plaintiff has named **THE HEIRS, BENEFICIARIES, REPRESENTATIVES AND CREDITORS OF THE ESTATE OF ANN-MARIE KENYON** as parties defendant in the complaint which it is bringing to the above-named court seeking a foreclosure of its Mortgage upon premises known as 27 PLAZA STREET, BROOKLYN, CONNECTICUT 06234. This complaint is returnable to the Court on March 15, 2016 and will be pending therein after that date.

The plaintiff has represented to said court, by means of an Affidavit annexed to said complaint, that despite all reasonable efforts to ascertain such information, it has been unable to determine the identity and/or whereabouts of **THE HEIRS, BENEFICIARIES, REPRESENTATIVES AND CREDITORS OF THE ESTATE OF ANN-MARIE KENYON, except for SHAUN KENYON, DEBBIE KENYON, JEAN MAYO, KELLY FRENCH, TRACEY WISSING and BRYNN BLAIS.**

NOW THEREFORE, it is hereby Ordered that notice of the institution of this action be given to each such Defendant by some proper officer causing a true and attested copy of this Order to be published in The Bulletin, once a week for two successive weeks commencing on or before March 2, 2016 and that return of such service be made to the Court.

Fun and Games

HOROSCOPE

ARIES (March 21-April 19): Assess your situation and what you need to do to bring about positive changes. Someone from your past will give you false hope. Don't rely on others for help, but make sure to get jobs finished on time. Be good to yourself. 3 stars

TAURUS (April 20-May 20): What you do to help others will pay off. A reunion will lead to an interesting and unusual offer. Take time out for personal care. Presentation matters, so put in the effort needed to look the part. Romance is in the stars. 3 stars

GEMINI (May 21-June 20): Be careful when sharing your ideas or possessions. You will attract people who have ulterior motives and could try to take credit for your work. If you don't believe in your abilities, it will be difficult to convince others to support your plans. 4 stars

CANCER (June 21-July 22): You may not like change, but this is an ideal time to embrace something new and challenging. Let your intuition guide you in a direction that promises greater creativity and opportunity. Romance will result in new beginnings and greater security. 2 stars

LEO (July 23-Aug. 22): Take the plunge and travel to a destination that offers something special. New connections will lead to a greater understanding of how you can establish yourself in a position that suits your skills, talents and qualifications. 5 stars

VIRGO (Aug. 23-Sept. 22): Spend more time on yourself, your family or something you believe in. Don't take a financial risk or overspend on something questionable. An unusual situation will develop with someone you have to deal with every day. 3 stars

LIBRA (Sept. 23-Oct. 22): Concentrate on what you know and what you need to learn to improve your chances of advancement. Don't be discouraged by someone who is offering negative feedback about your plans. Be true to yourself. 3 stars

SCORPIO (Oct. 23-Nov. 21): Speak up, share your ideas and bring about changes that will help you improve your community, neighborhood or lifestyle. A short trip will lead to a new endeavor. A romantic adventure will initiate creative ideas. 3 stars

SAGITTARIUS (Nov. 22-Dec. 21): Run your ideas by someone you trust. An unforeseen problem will develop if you move too quickly or don't take the time to test your plans before you begin. Don't go overboard. Start small and build slowly. Don't make decisions based on emotions. 2 stars

CAPRICORN (Dec. 22-Jan. 19): You'll face turmoil if you let things bother you. You may not be able to control what others do or say, but you can avoid attracting gossip and interference. Make your time and money count by spending it wisely. 2 stars

AQUARIUS (Jan. 20-Feb. 18): Avoid aggressive situations that have the potential to lead to an argument. Work by yourself. Don't present what you have to offer until you are fully satisfied that you have done your best. Strive for perfection, quality and balance. 4 stars

PISCES (Feb. 19-March 20): Keep your financial information private. An important partnership must be handled tactfully if you want to keep yourself from being taken advantage of. Avoid unpredictable people and situations. 3 stars

RE: Certificate of Need Application, Docket Number 15-32031
The William W. Backus/Hartford Hospital, Establishment of a Primary and Elective PCI

Dear Ms. Edwards,

The Office of Health Care Access ("OHCA") will hold a public hearing on the above docket number on March 23, 2016. The hearing is at 9:30 a.m. at the Department of Public Health, Office of Health Care Access, 410 Capitol Avenue, 3rd Floor Hearing Room in Hartford, CT 06134. Pursuant to the Regulations of Connecticut State Agencies § 19a-9-29(e), any party or other participant is required to prefile in written form all substantive, technical, or expert testimony that it proposes to offer at the hearing. OHCA requests that Middlesex Hospital ("Applicant") submit prefiled testimony by 4:00 p.m. on **March 16, 2016**.

All persons providing prefiled testimony must be present at the public hearing to adopt their written testimony under oath and must be available for cross-examination for the entire duration of the hearing. If you are unable to meet the specified time for filing the prefiled testimony you must request a time extension in writing, detailing the reasons for not being able to meet the specified deadline.

Additionally, please find attached OHCA's Issues. Please respond to the attached Issues in writing to OHCA by 4:00 p.m. on **March 16, 2016**.

ISSUES

Office of Health Care Access Docket Number: 15-32031-CON

The William W. Backus Hospital and Hartford Hospital - Establishment of a Primary and Elective PCI Program without Onsite Surgical Backup

The Applicants should be prepared to present and discuss supporting evidence on the following issues:

1. Clear public need for an elective PCI program at The William W. Backus Hospital.

2. Relevance of proposed "Backus Angioplasty Region" to elective PCI.

3. Ability of The William W. Backus Hospital to meet/maintain the ACCF/AHA/SCAI recommended minimum facility volume of 200 PCI procedures per year without a shift in volume from existing providers, including Hartford Hospital.

4. A proven gap in access to elective angioplasty unrelated to a shift in patient volume from existing providers.

5. The effect of a partnership between Day Kimball Hospital and UMass Memorial Medical Center on referrals from Day Kimball Hospital to The William W. Backus Hospital.

6. The effect that an elective PCI program at The William W. Backus Hospital would have on Lawrence + Memorial Hospital's overall PCI volumes.

7. According to the 2014 SCAI/ACC/AHA Expert Consensus Document "the addition of more PCI centers has not substantially improved access to PCI services for most patients." Please address this statement in the context of your proposal.

8. According to the 2014 SCAI/ACC/AHA Expert Consensus Document "multiple low-volume and partial-service PCI centers within a geographic area...increase costs for the overall health system and have not been shown to improve access." Please address this statement in the context of your proposal.

9. How it was determined that Ledyard and Montville patients would go to Lawrence + Memorial and not to The William W. Backus Hospital when inpatient discharge data indicates otherwise.

Provide a written response to the following as an attachment to the pre-file testimony, as these questions were not fully addressed in the application/completeness:

10. Provide the FY 2015 elective and primary PCI data on pages 465-466 and include Ledyard and Montville.

11. Data reported on pages 1444-1447 of the application do not match OHCA Hospital Reporting System Report 450 results. For example, OHCA Report 450 indicates the following statewide totals for the table on page 1446. Review and revise your response to completeness question #1, accordingly.

PCI	FY2009	FY2010	FY2011	FY2012	FY2013	FY2014	% Change FY09-14
Primary	2,844	3,408	3,522	2,998	2,775	3,276	15%
Elective	5,091	4,389	4,315	4,540	4,379	3,716	(27%)
Total	7,935	7,797	7,837	7,538	7,154	6,992	(12%)

Source: DPH Office of Health Care Access Hospital Reporting System Report 450

12. For the projections on page 1462, provide the data broken out by primary and elective rather than inpatient and outpatient PCIs for both OHCA defined primary service area and the proposed angioplasty region. Please note, replace Plainville with Plainfield in the OHCA defined-primary service area.

Greer, Leslie

Ms. Armah:

Attached please find a Notice of Appearance of Attorney Michele Volpe on behalf of Lawrence + Memorial Hospital in the above captioned matter and a Petition for Intervenor Status by Lawrence + Memorial Hospital in the above captioned matter regarding the public hearing on March 23, 2016. Please confirm receipt of these attachments.

Additionally, could you please send us a copy of Backus's pre-filed testimony filed with OHCA in the above captioned matter as soon as it becomes available?

Thank you,

IN RE: ESTABLISH AND OPERATE	:	
A PRIMARY AND ELECTIVE	:	
ANGIOPLASTY PROGRAM AT THE	:	
WILLIAM W. BACKUS HOSPITAL	:	**MARCH 16, 2016**

PETITION OF LAWRENCE + MEMORIAL HOSPITAL, INC.
FOR INTERVENOR STATUS WITH FULL PROCEDURAL RIGHTS
INCLUDING RIGHT OF CROSS-EXAMINATION
AT MARCH 23, 2016 HEARING

Pursuant to Conn. Gen. Stat. §§4-166 *et seq.* and §19a-9-27 of the Regulations of Connecticut State Agencies, Lawrence + Memorial Hospital, Inc. ("L+M Hospital" or the "Petitioner") respectfully petitions the Department of Public Health division of Office of Health Care Access ("OHCA") for intervenor status in the above-referenced proceeding with full rights, including the right to inspect and copy records, receive a copy of any and all correspondence submitted to OHCA, present written and oral testimony, evidence and argument, and to cross-examine the Applicants, William W. Backus Hospital ("Backus") and Hartford Hospital ("Hartford Hospital") and any witnesses in the above captured matter.

I. Preliminary Statement

Petitioner is a not-for-profit 308-bed acute care community hospital located at 365 Montauk Avenue, New London, Connecticut. Pursuant to Docket Numbers 04-30297-CON and 12-31768-CON, L+M Hospital operates a primary and elective angioplasty program.

Petitioner will present evidence that (i) there is no public need for the Certificate of Need ("CON") application submitted by the Applicants for the establishment of a primary or elective angioplasty services; (ii) Backus has not satisfactorily identified the population to be served; (iii) Backus has failed to comply with policies and standards adopted by OHCA; (iv) Backus has failed to comply with well-established clinical guidelines; (v) Backus has failed to comply with the state-wide health care facilities and services plan; (vi) there is no lack of capacity of either primary or elective angioplasty services and the proposed services will result in duplicative services; (vii) the proposed services will have a negative effect on quality, accessibility and cost effectiveness of healthcare services in the community; and (iix) the proposed services are not financially feasible and will negatively impact the financial strength of the health care system in Connecticut.

II. Manner in Which L+M Hospital's Interest is Affected by the Proposal

A. L+M Hospital's interests are greatly affected by the proposal to establish primary or elective angioplasty services in L+M Hospital's service area. If OHCA were to approve Backus Hospital's primary and/or elective angioplasty services, such approval will have an adverse impact on L+M Hospital. Such adverse impact on L+M Hospital will include, among other concerns, a shift of required volume thereby decreasing utilization at L+M and impacting quality; as well as resulting in an adverse financial impact on L+M.

B. L+M Hospital is a health care facility as defined by Conn. Gen. Stat. 19a-630. L+M Hospital is a not-for-profit acute care community hospital that provides a variety of services including primary and elective angioplasty in the area. L+M Hospital

recently received CON approval for its primary and elective angioplasty program pursuant to Docket Numbers 04-30297-CON and 12-31768-CON, respectively. L+M Hospital's primary and elective angioplasty services are supported by a collaborative relationship with Yale-New Haven Hospital and Yale School of Medicine.

C. In the development and approval of L+M Hospital's elective angioplasty program, L+M Hospital evaluated the existing patient population and service area. L+M Hospital's volume projections were subject to OHCA scrutiny and the extensive oversight and review during the lengthy CON application and public hearing process. OHCA found that the addition of L+M Hospital's primary and elective angioplasty programs is beneficial to the state. Pursuant to Docket Number 12-31768-CON, L+M Hospital is subject to continuing direct OHCA oversight regarding its volume and is required to submit quarterly utilization reports and quality data. L+M Hospital is also subject to the OHCA directive that providers and facilities maintain certain utilization levels to ensure an appropriate level of experience.[1]

D. As Petitioner will demonstrate in the testimony and evidence provided, approval of primary or elective angioplasty services in L+M Hospital's region and as proposed by Applicant will significantly impact volume and utilization at L+M Hospital. As noted in Backus's application, Backus estimates it will draw volume away from L+M Hospitals' still fledging program. By approving Backus Hospital's application for duplicative services, volume will shift from L+M Hospital thereby resulting in a decrease of utilization at L+M resulting in a negative effect on volume and quality for an existing and approved primary and elective angioplasty program.

[1] *Statewide Health Plan* at p. 41.

E. It is well established that "[c]ompetition with another PCI program in the same geographic area, particularly an established program with surgical backup, may not be in the best interest of the community."[2] Approval of a primary or elective angioplasty services at Backus will have an adverse impact on L+M Hospital's primary and elective angioplasty program.

III. Manner and Extent to Which L+M Hospital Proposes to Participate

L+M Hospital will participate in this proceeding as follows:

A. L+M Hospital proposes to present documentary evidence, direct testimony and arguments at the public hearing. L+M Hospital will provide OHCA with information showing (i) the Applicant has not demonstrated public need in the CON application for the establishment of a primary or elective angioplasty services; (ii) Backus has not satisfactorily identified the population to be served; (iii) Backus has failed to comply with policies and standards adopted by OHCA; (iv) Backus has failed to comply with well-established clinical guidelines; (v) Backus has failed to comply with the state-wide health care facilities and services plan; (vi) there is excess capacity for both elective and primary PCI and the approval of either primary or elective or both services will result in duplicative services; (vii) the proposed services will have a negative effect on quality, accessibility and cost effectiveness of healthcare services in the community; and (iix) the proposed services are not financially feasible and will negatively impact the financial strength of the health care system in Connecticut.

B. L+M Hospital requests that it be granted permission to cross-examine representatives of Backus and Hartford Hospital (and any other parties, intervenors

[2] *Statewide Health Plan* at p. 39.

and/or informal participants) on issues, including but not limited to, the impact of this proposal on L+M Hospital, the lack of public need for this proposal and other issues related to the services that L+M Hospital has specific knowledge.

C. L+M Hospital requests that it be granted permission to inspect and copy any and all documents in the record of this matter and that it be copied on all future submissions and correspondence. L+M Hospital further requests that it be granted permission to participate in any formal or informal meetings or discussions involving the Applicants and OHCA staff.

IV. The Manner in which L+M Hospital's Participation Will Assist OHCA

A. As an existing provider of primary and elective angioplasty services in the area, L+M Hospital is in a unique position to provide OHCA with information not otherwise available to the agency. L+M can offer insight regarding the accessibility of primary and elective angioplasty currently in the service area and the impact of the proposal on existing providers.

B. L+M Hospital will provide the evidence summarized in this petition as well as related points at the public hearing through the pre-filed testimony from witnesses and consultants employed by and/or retained by L+M Hospital. As an existing provider of primary and elective angioplasty services, L+M Hospital will furnish assistance to OHCA and serve as a provider resource in resolving the issues in this contested case.

C. L+M Hospital's participation in the proceedings is in the interest of justice and will not impair the orderly conduct of these proceedings.

V. Summary of Anticipated Evidence

L+M Hospital opposes Backus' proposal to establish a primary and/or elective angioplasty services and will present evidence that Backus has not met its burden under Conn. Gen. Stat. 19a-639(a). The following is a summary of the evidence that L+M Hospital will offer at the public hearing.

A. Backus Fails to Establish there is Public Need

Petitioner will present evidence that there is no clear public need for the proposed primary or elective angioplasty services. L+M will provide data omitted from Backus's application which shows that primary and elective volumes are declining in Connecticut and that such data will negatively change Backus's utilization projections. Backus has not established a demand for primary or elective angioplasty in the service area as residents can choose to obtain primary and elective angioplasty from two (2) existing full-service providers within 40 miles (Hartford Hospital) and 56 miles (Yale-New Haven Hospital) and primary and elective angioplasty provider within 17 miles (L+M Hospital). As well as four (4) out of state hospitals with PCI programs that are closer for patients. Backus does not provide an appropriate needs analysis and improperly relies upon a contrived service area. As important, L+M Hospital will illustrate that its provision of both primary and elective angioplasty services already meet the need and access requirements for patients in the service area; and L+M has excess capacity to accommodate any future increase or additional demand of both primary and elective angioplasty services.

B. Backus's Proposed Services Are Duplicative

L+M Hospital will present evidence that its provision of primary and elective angioplasty services: (i) is presently operating with excess capacity; (ii) is satisfying the needs of the community; and (iii) can absorb any future needs of the community for both primary and elective angioplasty services. Further, L+M Hospital will present evidence that the addition of a primary and/or elective angioplasty services at Backus will result in an unnecessarily duplicative service and that Backus has not provided any evidence that existing programs are not meeting the needs of the community, any way it is defined.

L+M will also provide evidence that Backus has not adequately described the population to be served and that Backus's inclusion of patients outside its service area is not appropriate. The Applicant is using its own made up service area ("Angioplasty Region") and not any historical service area or recognized OHCA service area for Backus Hospital. This methodology is unreliable and speculative and Backus has offered no credible evidence that it will reach the speculative utilization it projects.

C. Backus Fails to Prove the Proposal Will Improve Quality and Accessibility

Evidence will be provided to demonstrate that the well-recognized literature specifically indicates and states that both the primary and elective angioplasty services being proposed by Backus do not meet established guidelines regarding when it is appropriate to implement additional primary and/or elective angioplasty services.[3] Operating primary and/or elective angioplasty services within 17 miles of each other is

[3] *ACCF/AHA/SCAI Guideline for Percutaneous Coronary Intervention: a Report of the American College of Cardiology Foundation/American Heart Association Task Force on Practice Guidelines and the Society for Cardiovascular Angiography and Interventions*, as updated.

not recommended under any established guidelines and will adversely impact quality. L+M Hospital will offer evidence that true door-to-balloon time in primary angioplasty cases will not improve for nearly all of the patients residing in the towns listed in "Angioplasty Region".

D. Backus Fails to Prove the Proposal is Financially Feasible

Backus' proposal to establish primary and elective angioplasty services is not financially feasible, even if only primary angioplasty services are provided. The Applicant itself states this will not be a profitable endeavor. Application, p. 65. The services will operate at a projected deficit and require a $4.8-million-dollar investment to upgrade the Backus facilities. Backus fails to address how this deficit and investment upgrade will be financially prudent when Connecticut hospitals are facing serious financial challenges in the current healthcare market. Further, the Applicant's financial projections are void of the impact of declining volumes for elective and primary angioplasty services across Connecticut. All of which do not result in sufficient evidence to support the projected volume and utilization.

Conclusion

L+M Hospital will demonstrate, through evidence, testimony, documentation and established industry standards, along with information presented in rebuttal and cross-examination, that Backus has failed to meet its burden to establish a clear public need for either primary or elective angioplasty services. The Application uses speculative and inaccurate utilization figures making it clear that an additional, duplicative primary and/or elective angioplasty service is not supported. For the foregoing reasons, L+M

Hospital respectfully requests Intervenor Status with full rights, including the right of cross-examination, pursuant to Section 19a-9-27 of the OHCA regulations.

Pre-Filed Testimony

Dear Ms. Martone:

On behalf of Hartford Hospital and The William W. Backus Hospital, please find attached the following filings which are being submitted electronically, in PDF and Word formats (where applicable):

- **Responses to Pre-Hearing Questions**;
- **Exhibit 30** (Service Area Primary PCI by Town);
- **Exhibit 31** (Data Reconciliation Table);
- **Letter of Support from Greg Allard**, Vice President, American Ambulance ;
- **Pre-File Testimony of David Whitehead**, Senior Vice President & Chief Strategy and Transformation Officer, Hartford Healthcare (also past President & CEO, Backus Hospital);
- **Pre-File Testimony of M. Shane Foreman**, Founder & Chief Executive Officer, 3d Health;
- **Pre-File Testimony of Bimal Patel**, President, Backus Hospital & President, Windham Hospital & Senior Vice President, Hartford Healthcare;
- **Pre-File Testimony of Francis J. Kiernan, M.D., F.A.C.C.**, Interventional Cardiologist, Hartford Hospital & Director, Hartford Hospital Cardiac Lab & Director, Hartford Hospital Interventional Cardiology Fellowship;

brownrudnick.com

- **Pre-File Testimony of John A. Foley, M.D., F.A.C.P., F.A.C.C.**, Chief of Cardiology at Backus Hospital and Windham Hospital and Interim Medical Director of Specialty Care Services (East Region) at Hartford Healthcare and Director of Cardiovascular Services (East Region) for Hartford Healthcare.
- **Pre-File Testimony of Mariane Carna, R.N., M.S.N.**, Vice President of Cardiovascular Services at Hartford Healthcare.

Please note that Mr. Allard did not submit pre-filed testimony as he will not be available to testify on the morning of the hearing. Mr. Allard does plan to attend the afternoon session of the hearing and will be prepared to answer questions should they arise. Please do not hesitate to contact me if you have any questions.

Very truly yours,

BROWN RUDNICK LLP

IN RE:	**:**	**DOCKET NO. 15-32031-CON**
	:	
THE WILLIAM W. BACKUS HOSPITAL AND HARTFORD HOSPITAL'S CERTIFICATE OF NEED APPLICATION TO ESTABLISH A PRIMARY AND ELECTIVE PERCUTANEOUS CORONARY INTERVENTION (PCI) PROGRAM AT BACKUS HOSPITAL.	**:**	**March 16, 2016**

RESPONSES TO HEARING ISSUES 10-12

10. Provide the FY 2015 elective and primary PCI data on pages 465-466 and include Ledyard and Montville.

*See **Exhibit 30**, attached.*

11. Data reported on pages 1444-1447 of the application do not match OHCA Hospital Reporting System Report 450 results. For example, OHCA Report 450 indicates the following statewide totals for the table on page 1446. Review and revise your response to completeness question #1, accordingly.

PCI	FY2009	FY20	FY2011	FY2012	FY2013	FY2014	% Change FY09-14
Primary	2,844	3,408	3,522	2,998	2,775	3,276	15%
Elective	5,091	4,389	4,315	4,540	4,379	3,716	(27%)
Total	7,935	7,797	7,837	7,538	7,154	6,992	(12%)

Source: DPH Office of Health Care Access Hospital Reporting System Report 450

*See attached table (**Exhibit 31**) for detail and reconciliation.*

OHCA report 450 data was analyzed to determine Primary and Elective PCI historical trends by facility from 2009-2014 (the most current year of OHCA data available). The response to the Completeness Question #1, beginning on page 1445 considered programs at Bridgeport, John Dempsey, Hospital of Central Connecticut, Danbury, Greenwich, Hartford, L+M, Waterbury, St. Mary's, Norwalk, St. Francis, St. Vincent's, Stamford, and Yale, and did not account for New Milford Hospital, Connecticut Children's Medical Center ("CCMC"), or the Hospital of St. Raphael.

CCMC does not provide a traditional Primary and Elective PCI program, and these volumes are related to congenital conditions.

New Milford Hospital was also not included in the original analysis as data was only reported in FY 2009, with a total of 10 primary cases.

Finally, the Hospital of St. Raphael was omitted, as volume was not reported by St. Raphael in FY 2013-2014 (after acquisition by Yale New Haven Hospital).

Although three hospitals were not included in the original analysis, the response to the question remains accurate: data suggests that total PCI volumes in the State of Connecticut are not declining across the board. Even when including New Milford, CCMC, and St. Raphael's programs in the analysis, Primary PCI grew from FY2009-2014 by 18%.

While reported Elective PCI volume still declined (the initial analysis reported in response to completeness question #1 indicated a decline of 22% vs. 27% in the subsequent analysis which included the three facilities identified above) the reliability of the data remains questionable. Lawrence + Memorial reported no Elective volume in FY 13 or 14, despite receiving approval for an Elective program in February of 2013. St. Raphael reported no data in FY 2013-2014, however St. Raphael volume in FY 2009 impacted the analysis performed by OHCA, possibly exacerbating the true decline in volume (as St. Raphael's volume would be included in the denominator of the equation, but not in the numerator). Additionally, John Dempsey Hospital reported no Primary volume from FY 2009-2011, however reported Elective volumes for all years. Finally, New Milford Hospital reported 10 Primary cases in FY 2009 and no volume in following years.

These data integrity issues, in tandem with the wide swings in volume year over year, make it impossible to determine clear trends. The approach taken by 3d Health, and the creation of use rates to project need for future PCI interventions based on disease burden and demographic factors versus basing need in historic utilization creates a more accurate picture of need in a community, and for establishment of a program in Eastern Connecticut.

12. For the projections on page 1462, provide the data broken out by primary and elective rather than inpatient and outpatient PCIs for both OHCA defined primary service area and the proposed angioplasty region. Please note, replace Plainville with Plainfield in the OHCA defined-primary service area.

	Backus Angioplasty Region			OHCA-Defined Service Area		
Category	FY16	FY17	FY18	FY16	FY17	FY18

- Over the past seven years, there have been an average of 99 Primary PCI patients from the service area treated at Connecticut or Massachusetts hospitals.
- 84% of this volume originated from towns located within a 30 minute drive time to Backus.
- Larger clusters of Primary PCI cases are strongly correlated with larger population centers. However, incidence rates in general are low for this condition and year-to-year variation in volume by individual town is very common.

Department of Public Health
Office of Health Care Access
410 Capitol Avenue, MS#13HCA
P.O. Box 340308
Hartford, CT 06134-0308

Dear Commissioner Pino and OHCA Hearing Officer,

My name is Greg Allard and I am the Vice President of American Ambulance Service, Inc. (AASI) located in Norwich, Connecticut. American serves not only Norwich (with a population of over 40,000); we serve 22 communities in Eastern Connecticut including the Mashantucket Pequot Tribal Nation. In addition to all of our emergency responsibilities, we provide non-emergency or routine ambulance and wheelchair transportation. We work closely with all of our community hospitals and skilled nursing and rehab facilities.

Support for a PCI Program at Backus

As the major EMS provider in the defined Backus Hospital Angioplasty Region, AASI fully supports the CON application to provide Primary and Elective PCI at Backus. The reason for our support is two-fold. Most importantly, we believe having such a program is in the best interest of all of the residents in the community we serve and our patients are always our number one priority. Secondly, it will create efficiencies within our system that have the potential to improve our availability to respond to emergency and non-emergency requests and this is due to the fact that our ambulances will remain in our primary service area longer.

Some STEMI patients can be identified in the field via an EKG performed in the out of hospital arena, however this can only occur if a Paramedic is on-board, either at the time of patient pick up or through an "intercept" en route to the hospital. In the defined Angioplasty Region three EMS providers have Advanced Life Support (ALS) abilities. In total, these EMS providers can staff 17 Paramedic vehicles, on average; there are 14 available ALS vehicles during the day, and 7 during the night.

1504

Throughout the region there are many volunteer-based ambulance services that are Basic Life Support (BLS) capable and are not qualified to determine if a patient is experiencing a STEMI when picked up in the field. Thus, the potential exists for patients with unidentified STEMIs to arrive at Backus Hospital in need of Primary PCI if a Paramedic is not available.

Patients receiving diagnostic catheterizations that require Elective PCI also require transport via EMS to PCI-equipped facilities. Currently there is only one of those facilities in Eastern Connecticut and there are at least a dozen in the western half of Connecticut. Therefore, residents living in the Angioplasty Region must travel, by ambulance, significant distances for this life saving procedure.
Studies have proven that time is of the essence when dealing with STEMI patients in order to ensure the best possible health outcomes. So both Primary and Elective PCI can necessitate transport via EMS to a PCI-capable facility. As any commuter can tell you, travel times are highly dependent on weather conditions, traffic patterns and road work/construction as well as accidents. So the transfer times between facilities can vary greatly.

Additionally, on page 1449 of the Backus/Hartford Hospital Completeness Responses there is very valuable data provided by the American Heart Association's Mission: LifeLine that shows the Backus Hospital Angioplasty Region has: an average 75 minute transfer time for acute coronary intervention in New London County which has the third-highest mortality rate and, more importantly, it also includes Windham County (which has no access to a PCI capable provider in Connecticut) and it has the highest mortality rate in the State. A PCI program in Backus Hospital would therefore improve the timeliness of accessing critical, life-saving procedures.

Conclusion

For the reasons stated above, we at American Ambulance Service, Inc. urge the Office of Health Care Access to approve the William W. Backus Hospitals' request for PCI services.

Respectfully,

Gregory B. Allard, Vice President

Dedicated, Professional People Committed to Excellence, Caring for You.

PRE-FILED TESTIMONY OF
DAVID A. WHITEHEAD

Introduction

Good morning Commissioner Pino, Hearing Officer Hansted, and Office of Health Care Access staff. My name is David Whitehead and I am the Senior Vice President and Chief Strategy and Transformation Officer at Hartford Healthcare. I am also the past President and CEO of Backus Hospital and as such have been involved with this proposal from its inception. Given this history, I have the unique opportunity to convey the critical need for a Primary and Elective Percutaneous Coronary Intervention ("PCI") program in Norwich not only from a grass roots, local perspective but also from a global Hartford Healthcare vantage point. Today an inequitable distribution of crucial life-saving PCI services exists in our State. These services are a standard of care all individuals deserve access to, within the 30 minute transport time specified in the Office of Emergency Management Services ("OEMS") guideline issued in 2012, and yet no programs exist within a reasonable drive time for more than 230,000 residents of eastern Connecticut. Approval of this proposal, and establishment of this service at Backus Hospital, will respond to an identified community need by bringing quality interventional cardiac services through our partnership with Hartford Hospital to the communities served by Backus. This program will ultimately strengthen the entire healthcare network within the region.

Overview

This proposal requests approval for The William W. Backus Hospital ("Backus") and Hartford Hospital ("Hartford") to establish a Primary and Elective Percutaneous Coronary Intervention program at Backus Hospital (the "Program"). PCI procedures are performed in a cardiac catheterization lab, and are non-surgical procedures used to treat patients suffering from both acute and chronic cardiac conditions. Primary PCI, performed emergently, treats ST-Elevated Myocardial Infarctions ("STEMI"), a form of heart attack. In the case of these emergency situations a PCI must be performed in the shortest timeframe

possible, as any delay in care correlates to increased heart tissue death, and increases the chance of mortality or other undesirable clinical outcomes.

Elective PCI, or non-emergent PCI, is the standard for treating patients with symptoms of recurrent myocardial ischemia ("Unstable Angina" or "UA") and/or high risk findings on a non-invasive stress test. Elective PCI is often a scheduled procedure following extensive cardiac testing and/or a post-cardiac event (such as a Non ST-Elevated Myocardial Infarction) to relieve chest pain and related symptoms and, in many patients, prevent more serious heart conditions. Patients who undergo an Elective PCI have risk factors which show that if a PCI to correct the blockages causing the ischemia is not performed, the patient would be more likely to have a fatal myocardial infarction in the future. Unlike primary PCI, this procedure is scheduled, but ideally takes place within 24-48 hours of decision to treat. This effectively reduces the risk of future cardiac events. Once these patients have their coronary intervention, their reoccurring symptoms are alleviated and they are able to return to their baseline health.

Hartford Healthcare is dedicated to providing patients with an exceptional, coordinated care experience and a single, high standard of practice. A hallmark of Hartford Healthcare is to strengthen access to care that meets identified community needs by enhancing local healthcare delivery capabilities whenever possible. The establishment of a Primary and Elective PCI program within this region is supported by this strategy, and furthers the mission of Hartford HealthCare to improve the health and healing of the people and communities it serves.

ACCESS TO PCI

While analyzing Primary and Elective PCI services, Backus defined an Angioplasty Service Region to more accurately represent the provision of care in eastern Connecticut. Instead of using the traditional, hospital-centric Primary and Secondary Service Areas, the Angioplasty Region was defined through the analysis of zip code level data. This revealed a large geography where services are currently unavailable, and thus an unmet need to a well-documented clinical standard of care. This analysis further demonstrated that residents of the Angioplasty Region (the definition of which will be discussed further by 3d Health) are receiving PCI procedures at a lower rate than the rest of the State or Nation, and yet are suffering from myocardial infarctions at a higher rate than the State and Nation. Specifically, the rate of Primary PCI interventions for residents living in the Angioplasty Region is 18% below the statewide level and 8% below the national level (CON, Exhibit 8, Page 451). The rate of Elective PCI interventions for this same population is 19% below the statewide level and 41% below the national level (3d Health Assessment, page 17 (CON, Exhibit 8, Page 464). These figures are especially disturbing given the demographics of the Angioplasty Region. More than 45% of this population is over the age of 45, compared to 41% nationally. This region also suffers disproportionately from high rates of obesity, diabetes and smoking - all factors resulting in projected increases in the need for, and utilization of, cardiovascular services in this region. Social determinants of health, such as low socioeconomic status, high rates of underinsured and uninsured, and high a population-to-physician ratio, perpetuate the disease burden in this area. The Angioplasty Region also includes 3 towns designated as 'Health Professional Shortage Areas' and 11 towns designated as 'Medically Underserved Areas,' further compounding existing challenges to accessing care.

The lack of readily available PCI services in the Angioplasty Region places a burden on families and caregivers of patients who are transported to, or seek treatment from, hospitals far from home. Duplicative out-of-pocket costs associated with multiple hospital admissions and duplicative procedures, lost time at work, childcare fees and travel expenses are an economic burden to the residents of this region. Less quantifiable but equally important is the effect of stress on the family separated by illness and geography, as well as the impact on future care coordination and management of the patient's heart condition.

While it may be true that there is sufficient access to PCI services in many parts of the State, this is not the case for residents living in the defined Angioplasty Region. In eastern Connecticut only a small number of towns, those along the southeastern CT shoreline, have sufficient access to a PCI provider. Approximately 230,000 residents in the towns surrounding and to the north of Norwich do not have access to a PCI provider within a 30 minute drive time today. These residents must travel significant distances to receive this standard of care. In response to the Completeness Questions (page 1448) a table was provided detailing drive time estimates to the closest PCI facility for communities centrally located within the Angioplasty Region. The drive times are absolute minimums, calculated in the best of conditions, and range from 36 minutes to 57 minutes, well beyond the 30 minute transport time specified in the Office of Emergency Management Services ("OEMS") guideline issued in 2012. Drive time is important; in the case of an emergency time is muscle, so the less time elapsed from the onset of symptoms until the beginning of treatment, the greater the patient's chances of minimizing permanent damage to heart muscle.

As indicated by the map below, a saturation of programs exist along the shoreline and within the central region of the State. The blue shading on the map represents the 30 minute drive time from each PCI capable facility in the State of Connecticut. The Northeast corner of the State, a geography mirroring the defined Angioplasty Region, has virtually no shading, and thus no access to PCI services within a 30 minute drive time. This analysis is further supported by the American Heart Association's Mission Lifeline analysis of drive time and access to PCI capable facilities, with the same gaping hole indicated on their map (also included below). The Mission Lifeline data indicates this geography as suffering from the highest mortality rates associated with Acute Myocardial Infarction and the greatest transport challenges. According to Mission Lifeline, Windham County's age adjusted mortality in individuals 35 years of age or older is greater than 34.3-47.4 deaths per hundred thousand. This is the worst in the State, while New Haven and Fairfield Counties (where the region is virtually saturated with access to programs) has the lowest age adjusted mortality rate, with 29.1-29.4 deaths per hundred thousand. This data validates Hartford HealthCare's stance that access to PCI services must be improved in order to affect cardiac mortality rates.

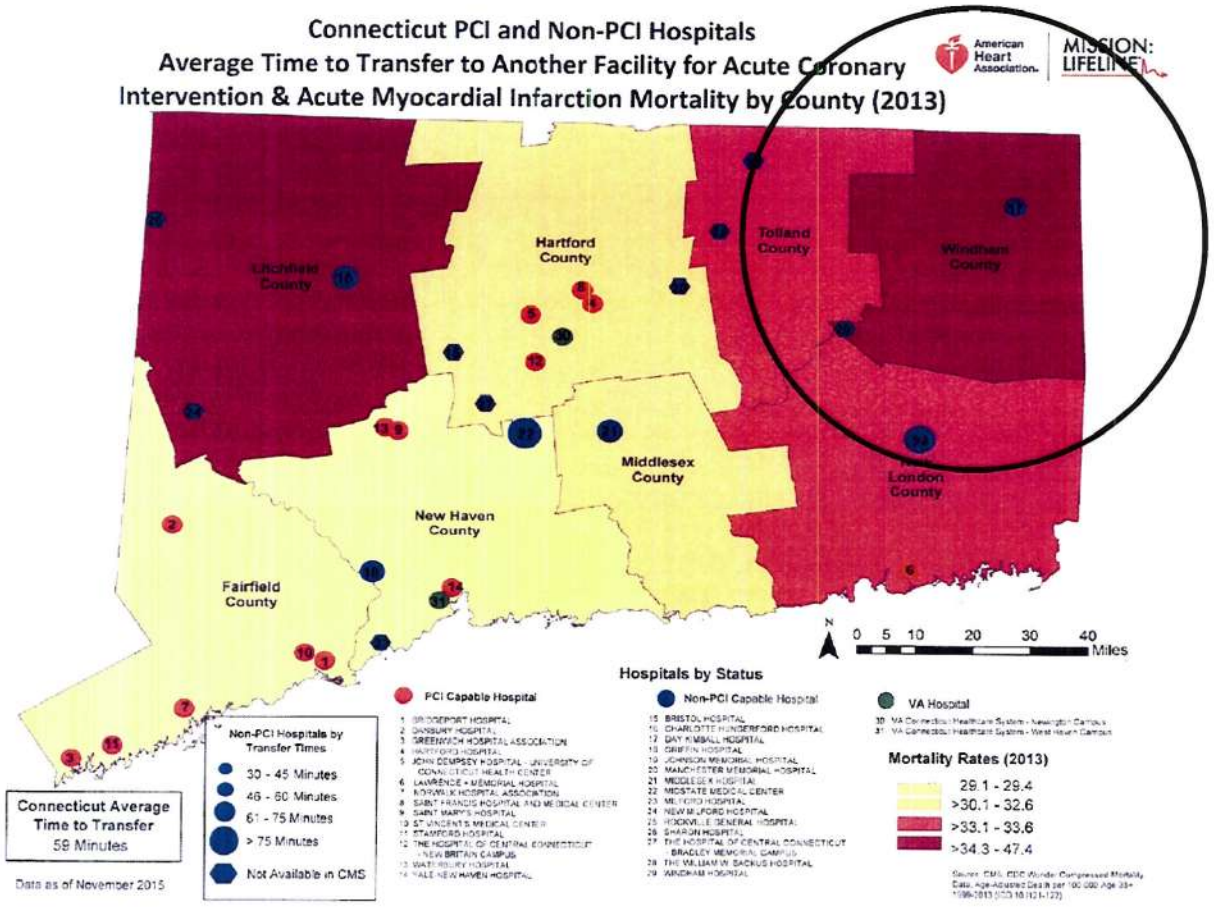
Data as of November 2015



Upon approval of this CON application, 118,000 residents in Eastern Connecticut (51% of the Angioplasty Region) will gain access to a facility offering PCI within a 30 minute drive time, and an additional 67,000 residents will have improved access within 10 minutes. Backus will become the closest PCI facility for an additional 28,000 residents in the Northeast portion of the state, and will become the closest Connecticut provider to 18,000 residents. This is significant, as residents of the far Northeast corner must seek these services out of state today.

This is not the first investment Backus Hospital has made in this region. In 2012 Backus established a full service, 24/7 satellite Emergency Department within the town of Plainfield for similar reasons. A need was revealed through careful market analysis, and a sound strategy to meet those needs was developed, and approved by OHCA on 12/3/2010, (Docket Number 09-31503-CON). The Backus Plainfield Emergency Care Center has fulfilled its mission and is providing emergency care to tens of thousands of individuals each year. Backus is further investing in the region through the development of a Center for Specialty Care. This center will house a full-time cardiology practice, among other specialty services, to enhance the access to primary and preventive care within the region. These investments support the population health model of care delivery that is being developed by Hartford HealthCare; however, like all public health and preventive health efforts, this approach will take many years to change the incidence of disease. Therefore, establishing a PCI program at Backus is necessary to treat the

population today, by providing individuals within the defined Angioplasty Region access to a life-saving clinical standard of care.

If this Application is approved, residents living in this geographically isolated and rural region will finally gain equitable access to a standard of care for the treatment of a leading cause of death. Therefore, I strongly urge you to approve this CON application and I thank you for your time today.

PRE-FILED TESTIMONY OF
M. SHANE FOREMAN

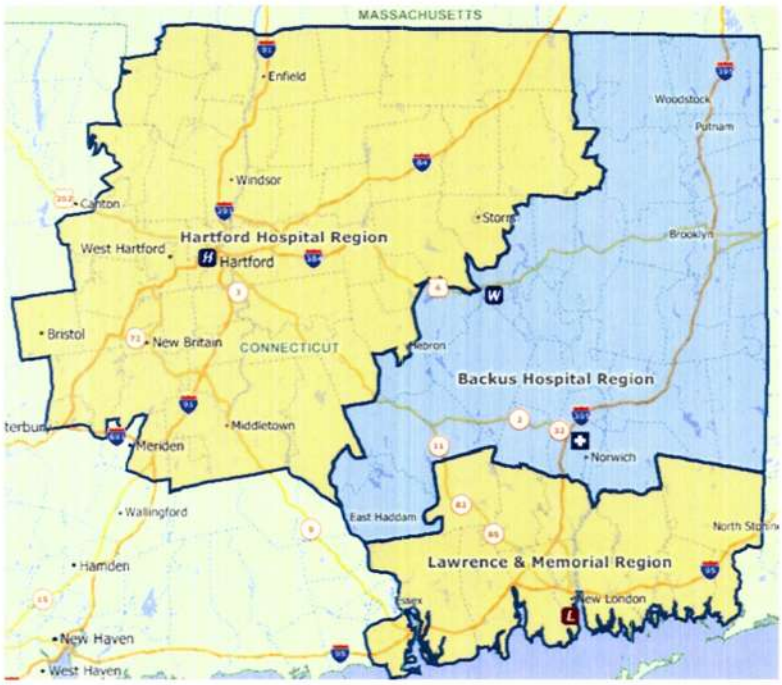
Introduction

Good morning Commissioner Pino and Office of Health Care Access ("OHCA") staff. My name is Shane Foreman and I am the Founder and CEO of 3d Health. Thank you for taking the time today to let me tell you about the clear public need for a Primary and Elective PCI program ("Program") located at The William W. Back Hospital ("Backus" or "Backus Hospital) and the set of analytics that we completed to come to this conclusion. Having completed a detailed market assessment, it is clear to me that a "hole" exists in northeast Connecticut where patients either do not have ready access to PCI services or are forced to leave the state for care.

The William W. Backus Hospital Region

In order to define the service area or "Region" that Backus Hospital would serve for PCI services, we relied on the State of Connecticut Department of Public Health guideline for transporting patients with prehospital-diagnosed ST Elevation Myocardial Infarction (STEMI). Under this guideline, STEMI patients with a transport time of under 30 minutes should be taken directly to a hospital with Primary PCI capabilities. As such, we used the 30-minute drive time as the standard for defining each Hospital's region.

In evaluating the potential for Backus to offer a Percutaneous Coronary Intervention ("PCI") program at the Hospital, 3d Health completed an in-depth drive time analysis for all of the towns in Eastern Connecticut. Each ZIP code was assigned to the closest potential Connecticut PCI facility, including Hartford Hospital, Backus Hospital, and Lawrence & Memorial Hospital. The resulting "Backus Hospital Region" is the defined service area for all of our analyses (please see the map below) and includes just over 230,000 patients.

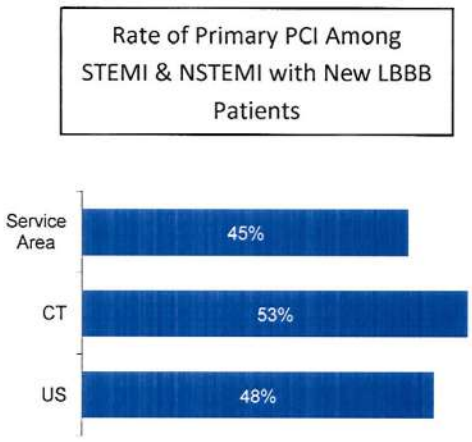


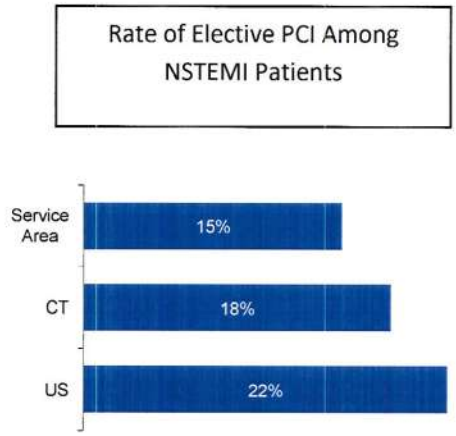
Based on the 30-minute drive time, there is a clear public need for PCI services within the Backus Hospital Region. Out of approximately 230,000 patients, 63% or 146,000 do not have access to a PCI facility within 30 minutes. Additionally, 18,000 patients are forced to leave the State in order to access PCI services within 30 minutes. The remaining 66,000 service area patients live within 10 minutes of Backus Hospital.

Incidence of Disease vs. Preferred Treatment

Overall, acute myocardial infarction ("MI") in the Backus Hospital Region has been increasing, up by over 12.6% since 2009 according to CHIME data. Based on CHIME data per 100,000 patients, the STEMI portion of the total acute MI volume in the service area is higher than the Connecticut average, 31% vs. 26% in the State. Based on CHIME Data per 100,000 patients and the latest data from the National Center for Health Statistics, the incidence of STEMI per 100,000 patients is also significantly higher in the Backus Hospital Region (104.3) than in both the state (83.0) and nation (81.9).

Yet, the rate of Primary PCI as an intervention for patients within the Backus Hospital Region is about 18% below the statewide level and 8% below the national level (chart on the left below). The Elective PCI rate of intervention for patients within the Backus Hospital Region is also well below state and national levels at 19% and 41% less, respectively (chart on the right below).





Current & Projected Volumes

According to CHIME and Massachusetts data, the volume of Primary PCI within the Backus Region has been relatively flat, with minor fluctuations on a year to year basis – from 8% up to 13% down in any given year. Similarly, the NSTEMI Elective PCI volume within the Region is flat, with year over year fluctuations – from 21% up to 14% down.

The large change within the market is a shift from Non-AMI Elective PCI being treated on an inpatient basis to the outpatient setting. From FY09 through FY14, Non-AMI Elective PCI volume from the Backus Region declined from 254 to 106 cases. At the same time, the Outpatient Elective PCI volume from this same Region rose from 33 to 204 cases, based on the percentage of total PCI cases that took place in an outpatient setting from the Coronary Angioplasty Patient Census Reports from the Connecticut Hospital Association.

To estimate future demand for PCI among Backus Hospital Region patients, 3d Health prepared market projections based on a set of utilization rates applied to the service area population. These utilization rates were calculated by age and gender using PCI volume originating across the state of Connecticut from FY 2009 through FY 2014. These rates also include an estimate for Connecticut patients treated at Massachusetts hospitals based on FY 2012 data. In modeling future inpatient Primary and Elective PCI volumes originating from the service area, 3d Health assumed no change in the underlying calculated utilization rates.

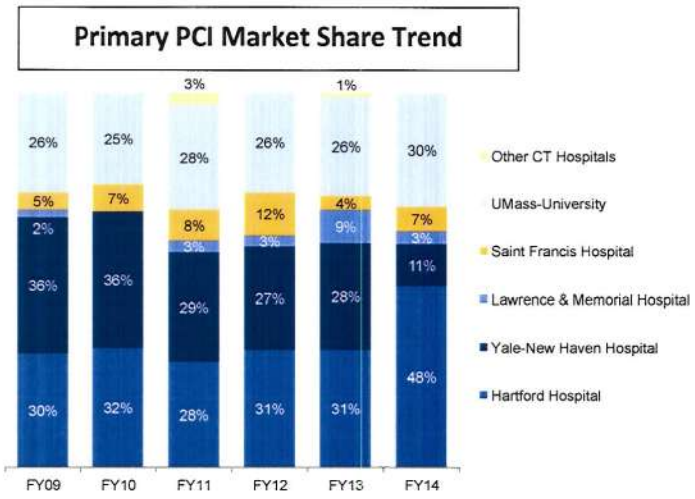
The net result of applying the CHIME-based utilization rates to the projected Backus Hospital Region is that the Primary PCI market volume grows from an estimated 104 cases in FY09 to 120 cases in FY20. The largest projected market change is in Elective PCI, with volumes growing from 408 cases in FY09 to 514 in FY20, driven by the increase in outpatient discussed above.

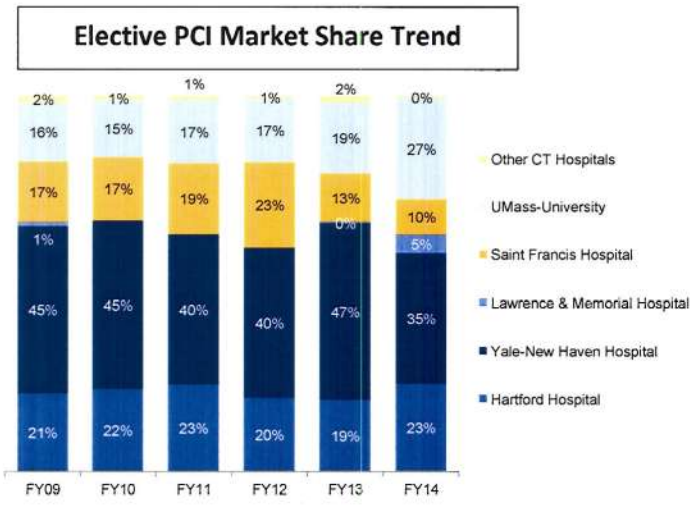
In projecting the potential PCI volume at Backus Hospital, 3d Health considered historic ED market share at both Backus Hospital and Windham Hospital, variation in ED market share based on proximity to each Hospital, ED in-migration rates, and we removed the complex Elective PCI cases from the analysis.

The resulting projected Primary PCI volume at Backus Hospital ranges from 79 cases in Year 1 to 82 cases by Year 5. The projected Elective PCI cases at Backus range from 151 in Year 1 to 167 in Year 5. The net result of the projected Primary and Elective PCI cases is a program that will complete between 216 and 233 PCI cases per year.

Impact on Other Facilities

As of FY14, almost 50% of the Primary PCI volume from the Backus Hospital Region is being treated at Hartford Hospital. Yale-New Haven Hospital treats 11% of these patients, followed by Saint Francis Hospital at 7% and Lawrence & Memorial Hospital at 3%. Virtually all of the remaining volume leaves the state for treatment. John Dempsey Hospital and The Hospital of Central Connecticut did not treat any Primary PCI Patients from the Backus Region in FY14.





For FY14, almost 25% of the Elective PCI volume from the Backus Hospital Region is being treated at Hartford Hospital. Patients from this Region opting to seek treatment at Yale-New Haven Hospital has trended downward by 10 points since FY09. Saint Francis Hospital treats 10% of these patients and

Lawrence & Memorial Hospital treats 5%. Virtually all of the remaining volume leaves the state for treatment.

In order to quantify the potential total impact of establishing the PCI Program at Backus Hospital on other providers, we utilized Backus Hospital's current inpatient market share of 36% from the Hospital Region and assumed 100% of the Hartford Hospital volume would move to Backus. Of the 216 projected Total PCI cases at Backus Hospital in Year 1, we anticipate 138 of the cases from Hartford Hospital, 54 cases from Yale-New Haven Hospital, 16 cases from Saint Francis Hospital, 8 cases from Lawrence & Memorial Hospital.

Conclusion

The proposed addition of PCI Services at Backus Hospital provides an exciting opportunity for 230,000 patients in Eastern Connecticut – the ability to receive PCI Services at a rate similar to the state and national levels, dramatically reduce the travel time for such services, limit the number of patients that must leave the state for care, and all without having a major impact on the existing facilities outside of the Hartford HealthCare family.

CHRISTUS Health (formerly Sisters of Charity), Alexandria, Louisiana; Chief Financial Officer, 1992

SUMMARY OF PROFESSIONAL AND BUSINESS EXPERIENCE

Hospital-Physician Joint Ventures

The Stark III final regulations published in September 2007 has reduced the number of relationship structures available to hospitals and physicians interested in partnering. Shane works closely with internal and/or external counsel to identify the structural options available at the outset of a project. 3d Health also has well established relationships with nationally recognized counsel that our clients are free to utilize.

Shane works with clients to identify, test, and confirm market opportunities and to negotiate and structure mutually beneficial relationships centered on capturing incremental patient volume and resulting market share.

Imaging Strategy

Developing an imaging strategy calls for a thorough understanding of the market, competition, and referring physician base. It also requires the ability to gauge any imaging opportunity in terms of capital expenditure and required return.

Shane works with hospitals, health systems, and physician groups on a wide range of strategic imaging services including market analysis, feasibility testing, referring physician requirements, cannibalization impact analyses, capacity analyses, reimbursement modeling, pro forma development, business planning, deal structuring, and new venture development.

Medical Staff Development Planning

A truly valuable Medical Staff Development Plan should provide a real-world assessment that helps identify both market opportunities and the right mix of physicians for a client organization. 3d Health combines senior management insight, medical staff perspective, best-of-industry data,

and a proprietary prioritization framework, to establish a strategic Medical Staff Development Plan.

Shane has extensive experience completing high impact and actionable Medical Staff Development Plans. He helps clients understand the physician resources required to achieve their market share and strategic objectives and has proven experience presenting results to executive teams, board members, and physician leaders.

Outpatient Strategy
A coordinated outpatient strategy not only requires a thorough understanding of a client's market, competition, and referring physician base, but it also calls for a detailed plan on how to best service a large volume of patients with high customer service demands – and to do it better than the competition.

Shane works with hospitals and health systems develop a comprehensive outpatient strategy that focuses on driving incremental market share, volume, and revenue while shoring up existing business.

Outsourced Analytics
3d Health has a demonstrated ability to identify the right analysis to quickly and effectively answer strategic questions facing client organizations. Shane helps clients outsource a portion of the business development and planning function and delivers the right analysis, perspective, and recommendations within aggressive time frames.

Physician Alignment Strategy
Shane has a long history of assisting hospitals in successfully developing and implementing physician alignment strategies. Whether the best strategy is physician employment, a joint venture, group practice development, development of call coverage arrangements, or a mutual focus on quality initiatives, Shane and 3d Health can help.

PRE-FILED TESTIMONY OF
BIMAL PATEL

Introduction

Good morning Commissioner Pino, Hearing Officer Hansted and Office of Health Care Access ("OHCA") staff. My name is Bimal Patel and I am the President of Backus Hospital and Windham Hospital and a Senior Vice President at Hartford Healthcare. Thank you for taking the time today to let me tell you about the overwhelming community support for a Primary and Elective PCI program ("Program") located at Backus Hospital has as well as the minimal impact this Program will have on existing providers.

Community Support

The need for Backus to establish a Primary and Elective PCI program is an integral part of its cardiac service line continuum, one that will improve the accessibility of cardiac services offered to the community. Backus has a commitment to the health and wellbeing of the community that goes beyond the walls of the Hospital. Backus has an active Community Health Education Department, which provides hundreds of low or no cost community programs and activities on an annual basis. Many of the programs sponsored by the Hospital relate to cardiovascular health.

There is tremendous support in the Angioplasty Region for Backus proposal to develop a PCI program. Backus reached out to the community, including fire department chiefs, ambulance personnel, physicians and municipal leaders, through phone calls, emails and face to face meetings to educate them about our proposed PCI Program. The feedback has been overwhelmingly positive and universally supportive. These stakeholders understand that there is a lack of adequate access to PCI services in the region and they can speak to the practical realities of this situation for area residents in need of care. We received letters of support from area fire departments, municipal leaders, physicians, and EMS personnel, all of which are included as part of our CON application.

Importantly, Robert Smanik, President of Day Kimball Hospital also provided a letter of support for our Program. Mr. Smanik indicated that Backus is increasingly looked to for its specialty services in our area and cited the improvement of patient safety with the reduction of travel times being a key factor motivating their support.

A PCI program at Backus will fill a void that exists in the eastern region of Connecticut and will improve the quality and accessibility of health care for these residents, who now must travel significant, unreasonable and unsafe distances, or be transported by LIFE STAR or EMS, for PCI services.

EMS Support

Notably, one of the biggest supporters of this Program is the EMS community. The EMS community understands that time is critical in these emergency cardiac situations and that patients would be better served obtaining life-saving procedures without lengthy travel times. In addition, when transport is needed from Backus to an out of market PCI facility, that emergency vehicle is tied up and unable to assist with other emergency situations.

Impact on Existing Providers

Backus' goal in obtaining Primary and Elective PCI is to provide a critical, life-saving procedure to the community it serves. The residents of this part of Connecticut deserve the same standard of care with regard to cardiac services that residents west of the Connecticut River enjoy. As Dr. Foley previously discussed, Backus has the capacity and physician support to establish a Primary and Elective PCI program. Currently the residents of Eastern Connecticut primarily travel to four Connecticut hospitals for PCI procedures. These facilities include Hartford Hospital, Yale New Haven Hospital, Lawrence and Memorial Hospital and Saint Francis Hospital, **none** of which are within a 30 minute drive time of the Angioplasty Region. No program currently providing PCI procedures will be compromised due to a shift of volume that would result of a Backus's Program. Each program will be able to maintain volume levels more than sufficient to meet the American College of Cardiology/American Heart Association's minimum standards. Specifically, Lawrence and Memorial Hospital ("L+M"), which serves a different market, only performed 22 primary and elective PCI procedures in FY2014 on patients from the Angioplasty Region. Additionally, self reported data filed by L+M with OHCA shows that in FY2015 17 of the 26 towns in the defined Angioplasty Region had no PCI patients served by L+M. The majority of cases are leaving the community altogether, seeking care at other high volume locations. On page 1467 of the Completeness Responses, a chart was provided detailing the PCI volume expected to shift to Backus (12.3% for Hartford, 14.8% for Lawrence & Memorial and 6.7% for Saint Francis) and the number of remaining PCI volume at each institution (964 for Hartford Hospital, 204 for Lawrence and Memorial and 776 for Saint Francis). This analysis clearly demonstrates that although volume will shift from other institutions, it will not compromise any of the existing programs in the State. Each hospital will be able to meet and maintain the ACCF/AHA/SCAI recommended minimum facility volume of 200 PCI procedures per year. It will, however, provide optimal patient access and bring a standard of care to a currently underserved market.

Commissioner, Hearing Officer Hansted, and OHCA staff, thank you for the opportunity to discuss with you this life saving program. I believe strongly that our community, our hospital and our providers are ready and willing to support this program. I am, of course, available to answer any questions that you may have.

Bimal Patel

Senior Vice President
Operational Integration

Hartford Healthcare

Organizational Description:

Hartford Healthcare: Operating company holding 6 hospitals, Physicians organization, Senior Services, Clinical Ancillary services, over $2.5B Net Revenue, 1600 acute care beds, 600 long-term care beds, and 16000+ FTEs

Hartford Hospital: Level 1 Trauma center - 867 Beds Acute Care Teaching Hospital, 5400 FTEs, $1.2 B net revenue

Mid-State Medical Center
Hospitals of Central Connecticut
Backus Hospital
Windham Hospital
Post-Acute Services: Senior care, Home care, Rehab services
Behavioral Health Services: Institute of Living, Natchaug Hospital and Rushford Hospital
Hartford Healthcare Medical Group

My Personal Purpose

Build a vibrant culture, develop leaders and help them find their best by using visionary, balanced and practical approach to deliver better quality of healthcare at affordable price point with un-matched service excellence and highest integrity.

Experiences

President, East Region and SVP HHC
Backus and Windham Hospitals **January 2016- Present**

Executive and leadership responsibility of the East Region of HHC including Backus and Windham hospitals, Plainfield emergency and ambulatory center, various outpatient clinics and urgent care centers, Backus physician organization and Conn Care network.

HHC responsibilities include Real Estate, Master planning and Contraction projects for the system.

Harford Healthcare, SVP Operational Integration **Dec 2014- Dec 2015**
Regional VP of Operations **August2013- Nov 2014**
Hartford Hospital, VP of Operations and Support **Feb 2009 – July 2013**

Responsibilities include operational integration reporting to EVP-COO of HHC System, I lead administration and management of major healthcare system initiatives such as Hospitals integration, System consolidation for efficiency and cost benefit, Spin-off key

service line to leverage capital, HHC 2020- infrastructure master plan and HHC Thrive-cost reduction.

Hartford Healthcare Thrive – cost reduction strategy, executive project leadership and Lean methodology:

- Responsible for the system Operating Margin goal via Balance Scorecard
- Reduced $195M in three years via partnership with Huron Healthcare Consulting largely focused on administrative services
- On target with additional $165M in one year improvement over $2.4B cost structure via administrative and clinical transformation work
- Productivity and efficiency infrastructure deployment to help achieve 25th percentile benchmark of these resources which resulted in over 500 FTEs reduction.
- HHC real estate portfolio
- HHC Lab Strategy deployment
- HHC Radiology Strategy leader
- Key administrative leader for all physicians driven clinical councils across HHC

Lead Healthcare System via following teams:

- Clinical and support integration of hospital operations – VP OPs
- Managing outsourcing and selling of clinical and support services for the system – M&A
- Develop Bone and Joint Institute in partnership with Orthopedic Physician Group(s).
- Build key strategic partnership with GE, Stanley, Siemens, CVS, Commercial labs - Strategy
- Develop retail healthcare via pharmacy, 340b, specialty and long-term care- Growth
- Help building HHC command center - Operations

Capital budget experiences and responsibilities:

- HHC2020 and routine Capital deployment annually at $ 100M
- $250M Strategic capital which included parking facility, ED expansion, and planning for Special Surgical Hospital for Ortho-Neuro-Spine.
- Facilities Master plan and support system growth initiatives
- Public utility company funds to improve power plant and fuel cell deployment

Key operational integration, leverage supply chain, engagement of physician leaders across the system and partner with nursing to horizontally integrate and deploy plan to improve efficiency, safety and quality.

Physicians and Nursing leadership experiences over ten years:

- Administrative member of Medical Executive Committee
- Clinical Chiefs council member
- Administrative leader for the Departments of Cardiology, Neurology, Radiation Oncology, Nephrology, Pulmonary, Pathology and Radiology.
- Management of service line leadership agreements

- Hospital Quality board and Safety Council
- Clinical nursing leadership in clinical ancillary and procedural areas
- Leadership of cardiac, vascular and endo-vascular platform
- Lead EPIC - EMR physician advisory committee and executive sponsor for EPIC rollout, bedside bar code, pharmacy systems, nursing and respiratory documentation

Board and non-profit community experiences:

- Member of Board Quality Committee
- Board of Governors for the hospital
- Connecticut Health Council member, a consortium of payers, providers, educators, suppliers, manufacturers, and consultants.
- Achieve Hartford Board member: Hartford Public Schools
- SINA (Southside institution of neighborhood alliance of hospitals and Trinity College) board member: community board for revitalization of neighborhood

Fund Development experiences:

- Meet and educate donors in and outside hospital
- Chair various fund raising committees
- Black and Red events raised $1M on annual basis
- Golf committee chair annual $400k raised
- Hospital Auxiliary Executive: annually raise and give $1.5M to hospital
- Open personal home for awareness and fund development

Community and Government experiences:

- Meet local leaders, Neighborhood Revitalization Zones, historical commission
- Interact with Mayor and administrative leadership of city including Planning & Zoning
- Interact with local senators and house representatives to build support and nurture relationship to promote organizational interests
- Attend political support functions as appropriate
- Emerging as a key executive for community connection

Achieved Objectives

- Hospital patient satisfaction has improved by 40 percentile points in 3 years after establishing Patient Experience Officer in a cost neutral method.

- Established productivity model for the hospital and system including position review committee structure and shift management tool.

- Became part of a team lead Hartford Hospital from $8M loss to gain of $53M over 4 years period from 2008 to 2012.

- Improve cost structure by $195M in first three years for the hospital and system while working towards a goal of new $165M over current year.

- Improved the food service program to ensure it is providing the highest level of quality, while minimizing costs. Patient Satisfaction scores went up by 70%.
- Prioritize and manage the various capital projects approximately $350 million over past five years including $150M Bone and Joint Institute
- Built CESI (center for education, simulation and innovation) and obtained grant of $15M from the state
- Wrote and received NIH grant of $3.5M construction for expanding neuro-psych research

Robert Packer Hospital – Guthrie Health System **March 2006 – Jan 2009**
Administrative Director Professional and Support Services
230 Beds Acute Care Teaching Hospital
Level II Trauma Center

Professional and Support Services responsibility included the administration and management of both clinical and support service functions for the Robert Packer Hospital. **Clinical areas** of responsibility included Cardiology, Oncology, Nephrology, Neurology, Radiology, Pathology and Critical care via oversight of Cardiac Cath lab, EP lab, Radiology, Neurology, Sleep services, Dialysis, Radiation Oncology, Respiratory Services and Pharmacy. Support services included Engineering and facilities, Environmental services, Biomedical Engineering, Laundry and Food Services, Patient Transport, Switch-board and Security.

Key achievements during three years were as follows.

- Solucient Top 100 hospital for 2 of the 3 years
- Top 100 Cardiovascular hospital for all 3 years
- Profitable operation with operating margin of 8-10 % annually for 3 years
- Employee satisfaction changed to top quintile
- Lead value analysis as a chair of the committee for the Guthrie Health System for two years with savings of 2 plus million each year above budget
- Help flatten the administrative structure with reorganization
- Stabilized the for-profit division of hospital during crisis
- Executive sponsor and successful implementation for the EPIC ® bed-side bar-coding, nursing documentation, e-MAR and pharmacy systems.

Robert Packer Hospital – Guthrie Health System **June 2004 – Feb 2006**
Administrative Director Pharmacy Services
230 Beds Acute Care Teaching Hospital
Level II Trauma Center
200 Beds long term care facility

Pharmacy services chief for both acute care hospital and long-term care. Total employees 40 with drug budget of 20 million.

Key achievements during two years period were as follows.

- Merge the long term care pharmacy in to retail operation during Medicare Part D and made profitable as well as compliant to regulations
- Renegotiated system contract with pharmaceutical venders and generated additional savings of $1.5 – 2 million annually for two year
- Stabilized the CPOE system which was failing due to pharmacy interface
- Cleaned CDM and revenue cycle processes
- Changed service orientation of pharmacy

Good Samaritan Hospital – GHS **December 1999 – May 2004**
Supervisor Pharmacy and Home Infusion Services
200 Beds Acute Care Teaching Hospital
35 Beds TCU, Rehab and Oncology Services

Pharmacy services supervisor of two sites. Delivered care to variety of services including acute care hospital, long-term care, rehab in-patients, home infusion and oncology outpatient infusion services.

Key achievements during four year period were as follows.

- Expanded home infusion services
- Rebuilt oncology service model
- Cleaned up inventory with 16 inventory turns and process improvements in contract compliance
- Service excellence superior status of pharmacy from customer base of nursing and patients

<u>For Profit Experiences as follows:</u>

Owen Healthcare- Cardinal Health **July 1996-December 1999**
Clinical Staff Pharmacist
On-call Special projects for north-east

During this time period, I worked at various North-East US hospitals for different reasons including start ups, close outs, staffing needs, administrative needs, regulation preparedness, information technology roll-out and program set ups.

Owen Healthcare- Cardinal Health **January 1995 - June 1996**
Director in Training
Management Fellowship

One and half years of both corporate and local hands on experience as well as curriculum based formal fellowship training with Owen Healthcare. A national hospital pharmacy management company with 300 plus hospital pharmacies in forty plus states. During this

period learned various aspects of pharmacy services including financials, clinical, IT and technical, managements and contracts, regulatory and P&T.

Owen Healthcare- Cardinal Health **March 1993 – December 1994**
Staff Pharmacist

During this period I functioned as a staff pharmacist for acute care hospital working directly with nursing, physicians and other clinical services. This experience helped build the quintessential base needed for future growth and development.

Education

BS in Pharmacy, LMCP, India 1990
Management Fellowship, Owen Healthcare, 1995
Certified in Long Term Care, Penn State University, 2003
Masters in Health Administration, Penn State University, 2004

References upon request from current and past work will be available.

PRE-FILED TESTIMONY OF
FRANCIS J. KIERNAN, M.D., F.A.C.C.

Introduction

Good morning Commissioner Pino, Hearing Officer Hansted, and Office of Health Care Access staff. My name is Francis J. Kiernan and I am an Interventional Cardiologist at Hartford Hospital and Director of the Hartford Hospital Cardiac Lab and Interventional Cardiology Fellowship. Upon CON approval, I will oversee the Primary and Elective PCI program at Backus Hospital and oversee the relationship with Hartford Hospital.

Hartford Hospital is a regional provider for cardiovascular services, and through the establishment of a Primary and Elective PCI program at Backus, will be able to provide consistent coverage for the program, standardize practice and ensure quality of care in accordance with Hartford Hospital standards. Hartford Hospital will have the ability to work collaboratively with both employed and independent providers in developing the program. The benefit of such an affiliation is to provide patients in the Backus Angioplasty Region with access not only to PCI services, but to expertise in subspecialty areas, surgical expertise from Hartford Hospital in a market that has no providers of open heart surgical services, and an ability to access, and participate in, an established quality program to standardize practice and monitor key core measures and outcomes.

Standard of Care

Today, percutaneous coronary intervention ("PCI") is, and has long been recognized as the national standard of care for the treatment of acute myocardial infarction. Elective or urgent PCI is an important tool for the management of patients with coronary artery disease. All residents in Eastern Connecticut and residents in the Angioplasty Region, not just those in the greater New London area, deserve the same medical standard of care and access to the same level and quality of services. Data clearly

demonstrates that currently residents of the Angioplasty Region are receiving this standard of care (Primary and Elective PCI) at a lower rate than the rest of the State and Nation.

Connecticut's Department of Public Health guidelines highlight the relationship of time with clinical outcomes in the case of patients requiring a PCI for acute myocardial infarction or STEMI (which should be administered as soon as possible after the onset of symptoms). These regulations set a standard of care for STEMI patients, who, when identified in the field, should be transported to the closest PCI-capable facility, if there is one within a 30 minute drive time of the patient. For patients in the Angioplasty Region, all PCI-capable facilities are more than 30 minutes away.

Door-to-Balloon Time

The ACC/AHA STEMI Guidelines provide that "door-to-balloon" time ("DTB") – which is measured from when a patient presents at the Emergency Department at a PCI capable center to inflation of the balloon that opens the occluded artery – should not exceed 90 minutes. DTB times are often adversely impacted when a patient presents with a STEMI at a hospital without an angioplasty program. The process of evaluating patients in a community hospital and then transporting them to a PCI equipped hospital inevitably entails delays (such as delays associated receiving the patient and arranging for their transfer), and those delays result in preventable damage to heart muscle. Studies demonstrate that time is one of the most important factors in saving heart muscle during a cardiac emergency. The less time elapsed from the onset of symptoms until the beginning of treatment, the greater the patient's chances of minimizing permanent damage to heart muscle.

For Backus, current DTB times for patients transferred to PCI-capable facilities do not consistently meet the AHA/ACC STEMI Guidelines' optimal 90 minute time. An analysis of 105 Acute Myocardial Infarction patients who presented at Backus between FY 2011-May of FY 2015 indicated that the median DTB time for patients transferred to either Yale or Hartford Hospital was 134 minutes, with only **10%** (11 cases) treated within the recommended 90 minute DTB time (3d Health Assessment, p. 26). Thirty percent (30%) of patients transferred exceeded the 90-minute DTB recommendation by an hour. Overall, 59% of DTB times were between 90 and 150 minutes, (3d Health Assessment, p. 27). Importantly, transport time accounts for **over half** of the DTB minutes associated with transfers from Backus to YNHH and Hartford Hospital.

Door-in-Door-Out

Door-In-Door-Out ("DIDO") is the length of time from presentation at the community (non-PCI equipped) Emergency Department to transport to a Primary PCI equipped hospital. DIDO plays a major role in overall DTB time. DIDO should be limited to 30 minutes. From FY 2011 to May 2015, the median DIDO for the 285 STEMI patients who presented to Backus was 73 minutes (3d Health Assessment, p. 28). Only **11%** of cases met the recommended DIDO time of 30 minutes. Backus has worked to minimize DIDO delays through multiple strategies in the Emergency Department, which are detailed in the CON (see page 50-52). Backus, however, has reached the limits of its ability to lower DIDO times for patients who must be transferred to another facility for Primary PCI. Further decrease will be difficult due to factors beyond Backus's control, including activation and arrival of EMS transportation, which

adds substantial time to the total DIDO for STEMI patients arriving at the Backus Emergency Department. (3d Health Assessment, p. 29).

Delays associated with diversion and transport increase the total ischemic time (the amount of time from symptom onset to treatment), which also must be managed in order to ensure the highest quality clinical outcomes. In the case of a Primary PCI, time is muscle, and so a shorter transport time will likely reduce necrosis and ultimately improve patient outcomes. In the case of Elective PCI patients, time is still of the essence. Elective procedures can be time-sensitive and urgent procedures. The timing guidelines are not applicable to Elective PCI patients, but the elimination of a 30 minute drive time will improve ease of access to this care and ease the burdens on family members who will have to travel to the referral center.

Hartford Hospital

Hartford Hospital is one of the Region's leading providers of comprehensive cardiac services and it will provide the necessary training, oversight, and tertiary backup to ensure a high quality, efficient, and seamless PCI services at Backus. Hartford Hospital's Henry Low Heart Center is a full service cardiac provider, offering an array of comprehensive services and sophisticated techniques in a setting of highly personalized care. Hartford Hospital has a history of extraordinary quality outcomes. The National Cardiovascular Data Registry ("NCDR") report for the four quarters ending in Q3 2015, Hartford performed 1,174 PCIs. Of these, no patient required emergency CABG. These are phenomenal results, which illustrate the expertise and high quality of care delivered by Hartford Hospital physicians, as well as the safety and efficacy of delivering PCI services.

Both Hartford Hospital and Backus Hospital are members of Hartford Healthcare. Approval of the CON application will allow Backus to establish an interventional cardiac program through leveraging the existing expertise and experience at Backus in related fields and the expertise and experience of its tertiary/quaternary care partner, Hartford Hospital. The same high quality outcomes are anticipated at Backus, as the same physicians will be providing care, and will be held to the same standards as Hartford Hospital.

The Applicants plan to staff the Backus PCI lab 24/7, 365 days a year with on-call personnel available during the off hours. There will be an Interventional Cardiologist performing all PCI procedures with two RNs and two Radiologic Technologists in the room during each procedure. Backus also has emergency transfer agreements already in place with Hartford Hospital. Backus has also developed an on-call system to allow patients to have PCI performed within 90 minutes of the first medical contact (details can be found on page 30 of the CON).

The physicians participating in the Backus PCI program will be an extension of the Hartford Hospital interventional physician team. All physicians covering the Backus program will work under my oversight. The group providing PCI services at Hartford Hospital, Hartford Cardiac Laboratory, P.C., currently employs 7 physicians and has committed to provide clinical and administrative support to the Backus PCI program. Additionally, a private physician, Dr. John Michael Chua Chiaco, has committed to provide PCI coverage at Backus (CV attached as Exhibit 7 to the CON and Letter of Support attached as

Exhibit 11 to the CON). Dr. Chua Chiaco currently practices at Backus, and is located in Norwich, Connecticut. Efforts to recruit a new physician will begin once we have CON approval. The new physician will partner with Hartford Cardiac Laboratory, P.C. to provide coverage to Backus. This newly recruited physician will also rotate through the Hartford Hospital cardiac catheterization lab.

These physicians all provide coverage, or will provide coverage (in the case of any newly recruited physicians), at other hospitals, and will continue to do so after the Backus program is established. The rotation through programs at high-volume PCI centers ensures the physicians providing coverage at Backus will meet all operator minimums (as specified by the ACC/AHA guidelines and the State Health Plan), and are highly technically skilled. Furthermore, these physicians will be required to abide by pre-determined quality standards. This strong connection with Hartford Hospital's program and physician leadership will ensure the services provided at Backus are of the highest quality and produce strong clinical outcomes.

Establishing a Primary and Elective PCI program at Backus will upgrade all aspects of the hospital by providing higher levels of training and creating an elevated attention to detail that permeates the whole hospital. Importantly, Hartford Hospital will also benefit with the approval of this PCI program. A capacity analysis for Hartford Hospital's cardiac catheterization labs was conducted to understand whether there would be a benefit to Hartford if PCI volume was served locally at a Backus program, rather than transferred. The analysis indicated that during FY2014 Hartford Hospital was operating at approximately 92% of capacity (3d Health Assessment, p. 35). Thus, Hartford Hospital is at nearly full capacity within its existing infrastructure. The addition of a Backus program would therefore not only improve the DTB times for patients presenting locally, but would also help to ease some capacity constraints currently occurring at Hartford Hospital, as individuals currently requiring PCI who are traveling to Hartford for care would be able to receive the same care locally. This reduces the volume of patients treated at Hartford, without eroding the Hartford Hospital PCI program, and increases the Hartford Hospital's capacity without actually increasing the number of catheterization labs at Hartford Hospital.

Conclusion

Currently, the Door-In-Door-Out and Door-to-Balloon times for patients in the Angioplasty Region are outside acceptable windows. A PCI program at Backus will allow residents of the Angioplasty Region to obtain the care they require within the ACC/AHA STEMI Guidelines optimal timeframes. Timely access to PCI saves lives and improves health, and the people in that part of the State deserve the same standard of care and services that most all other Connecticut residents enjoy. The geographic "dual standard of care" that exists today in Connecticut should not be allowed to continue. Thank you for your time today.

PRE-FILED TESTIMONY OF
JOHN A. FOLEY, M.D., F.A.C.P., F.A.C.C.

Introduction

Good morning Commissioner Pino and Office of Health Care Access staff. My name is John Foley and I am the Chief of Cardiology at Backus Hospital and Windham Hospital as well as the Interim Medical Director of Specialty Care Services; East Region and Director of Cardiovascular Services; East Region for Hartford Healthcare. I will be speaking today about the services currently offered by Backus as well as Backus offering Primary and Elective PCI.

Overview

Backus is an acute care general hospital in Norwich licensed for 233 beds/bassinets that offers a full range of inpatient and outpatient medical services to Eastern Connecticut including Diagnostic Cardiac Catheterizations. Backus is continually evaluating the need for new programs that will enhance timely access to life-saving services for the residents of eastern Connecticut. To that end, Backus and Hartford have submitted this CON application to expand the cardiac catheterization services offered at Backus to include an interventional cardiac program to perform Primary and Elective PCI. Although there is abundant need for PCI services in the Angioplasty Region (as defined by, and further explained by, 3d Health) where the patients are older, have more cardiac risk factors and are of a lower socio-economic status, there is not sufficient access to PCI services.

Over the last four years, Backus has made necessary investments to enhance the cardiovascular services it offers to the residents of eastern Connecticut including upgrading its cardiac catheterization lab equipment and integrating its new system into the Hospital-wide informatics system. In addition to the catheterization lab upgrades, the Cardiology Service Line started a Vascular Steering Committee, Chest Pain Observation Unit, Heart Failure Program, and is currently expanding the existing Peripheral Vascular program. The continued development and expansion of a Heart Failure Program is a specific strategic priority at Backus, with a focus on infusion services and education.

Backus has also set in motion the steps to provide Primary and Elective PCI service to the Angioplasty Region including performing extensive market analysis, aligning physicians, completing transfer agreements and determining the physical plant requirements. In addition, Backus plans to build an additional catheterization lab suite and will also create a back-up catheterization lab in the current Backus interventional radiology suite.

Primary & Elective PCI

Primary PCI is used to treat emergency situations and is the most effective way to treat the most common form of heart attack known as a ST-Segment Elevation Myocardial Infarction ("STEMI"), as well as new or presumed new onset Left Branch Bundle Blockage ("LBBB"). As previously mentioned by Mr. Whitehead, despite the demographics of the region (older with a higher prevalence of key risk factors for coronary heart disease) the rate for Primary PCI intervention is well below the State and National levels.

One way for a patient to access Primary PCI services is to be picked up by EMS and identified in the field as STEMI patient then transported to the closest PCI-capable facility (if there is one within a 30 minute drive time). Patients also present at the Backus Emergency Department with STEMI/LBBB and are typically transferred more than 40-50 miles to hospitals with PCI programs. Virtually all of these patients could be cared for at Backus if Backus offered PCI services. The delays associated with that transfer result in many patients not receiving Primary PCI within 90 minutes of presentation at an Emergency Department, as recommended by the ACC/AHA and as the standard of care dictates (Dr. Kiernan will discuss this further). Delays associated with diversion and transport also increase the total ischemic time (the amount of time from symptom onset to treatment), which also must be managed in order to ensure the highest quality clinical outcomes.

Elective PCI is the standard for treating Acute Coronary Syndrome (Non ST-Elevation Myocardial Infarction, "NSTEMI") in people with intermediate to high risk factors. Elective PCI is also the standard for treating patients with symptoms of recurrent myocardial ischemia ("Unstable Angina" or "UA") and/or high risk findings on a non-invasive stress test.

Over the last four years Backus transferred an average of 70 patients each year who, while receiving a diagnostic catheterization, were identified as requiring an Elective PCI. These patients are transferred from Backus to a PCI capable facility via EMS and endure duplicative services. These patients undergo a repeat catheterization to clear the blockages found in the initial procedure which often this requires another groin or radial puncture to the patient. This increases the risk of infection to the patient, and other arterial complications, as many times patients are transported with a sheath in place. It also duplicates the patient's exposure to radiation and sedation, as a repeat procedure must now take place.

These duplicative services not only compromise the quality of care received and the clinical outcomes, but they increase the cost of care. The logistics of traveling to a different hospital far away from your home can be challenging for many of the residents in the Angioplasty Region. Windham and

Northeastern Connecticut have some of the lowest numbers of motor vehicle registrations and rely more heavily on limited public transportation services, medical cab services, and taxi cabs for transportation. These transportation services, although widely used, are limited in scope and operation and may prove to be a financial hardship. When individuals without their own vehicle must leave their home communities for medical care the travel arrangements and time can be onerous and costly. The difficulty in securing reliable transportation impacts an individual's decision to seek care, and makes it difficult for an individual to receive regularly scheduled cardiac rehab or follow up after a procedure. Therefore, traveling such distances increases the burden on family members who must meet their loved one in an unfamiliar facility and city in an already stressful situation. Further, it is an impediment to patients receiving the proper follow up care.

Most importantly, transferring patients for PCI leads to a worsened patient experience. This is especially the case with Elective PCI. Individuals requiring Elective PCI are very sick people, many with co-morbid conditions. Many of these patients have been subjected to a long series of tests and procedures and gone through multiple visits with their doctor and have developed a level of trust and familiarity that provides an immeasurable amount of comfort to them and their families. Their doctors understand their history and current medical needs and are in the best position to make the decision about the most appropriate next steps in the patient's care plan. When patients are transferred to a different hospital for Primary or Elective PCI, this necessary information is not always communicated effectively and the patient is forced to interact with a completely new set of healthcare professionals. The investment in a PCI program at Backus Hospital will greatly improve the patient experience by lessening the anxiety associated with being transferred to a new hospital. It will also improve patient outcomes and treatment plans, as their local cardiologist, who knows the patient best, will be performing the procedure and providing the necessary follow up after the procedure is completed.

Referrals

There is no referral base for Primary PCIs – these are emergency cases and are brought in through the EMS network, based on DPH guidelines and medical oversight. At times EMS transports patients to Backus because it is the closest facility for an unidentified STEMI, there is not a PCI capable provider within 30 minutes for an identified STEMI, or because a patient requests a transport to Backus. These referral patterns are not expected to change if the proposal is approved. What will change is Backus' ability to provide timely access to PCI services to area residents rather than transferring them to facilities in New Haven or Hartford.

Elective PCI cases are subject to patient and physician selection, as well as those patients identified as requiring an Elective PCI while undergoing a diagnostic catherization at Backus. Within the Angioplasty Region there are three cardiology groups practicing at Backus. These practices include the Yale Medical Group, Norwich Cardiac Medicine, and Hartford HealthCare Medical Group. Two interventionalists currently have privileges at Backus to work in its diagnostic catheterization lab. In total, these practices employ 16 physicians. Upon approval of the program, Hartford HealthCare Medical Group will recruit other Interventionalists to work at Backus under the clinical oversight of Dr. Francis Kiernan, the lead Interventionalist practicing at Hartford Hospital. The Interventionalists participating in coverage at

Backus will also rotate through Hartford Hospital's catheterization lab to ensure adherence to clinical standards, and operator minimums are met and sustained.

The Applicants are not aware of an existing partnership between Day Kimball and UMass Memorial Medical Center and therefore are not in a position to speculate how any such partnership would effect referrals from Day Kimball to Backus.

Conclusion

I look forward to the day that I no longer have to look into the face of a patient or family member who is frightened by the prospect of traveling a long distance to be cared for by doctors and nurses they don't know. In the fifteen years I have lived and practiced in the Norwich area, I have witnessed OCHA's willingness to adapt their rules in order to benefit patients and their families. The need for safe, timely, and expert Primary and Elective PCI in the Angioplasty Region of Connecticut has been firmly established. I wholeheartedly support this CON application as a way to advance valuable, necessary care and access to patients in the Angioplasty Region.

PRE-FILED TESTIMONY OF
MARIANE CARNA, RN, MSN

Introduction

Good morning Commissioner Pino, Hearing Officer Hansted, and Office of Health Care Access ("OHCA") staff. My name is Mariane Carna and I am the Vice President of Cardiovascular Services at Hartford HealthCare. I would like to focus today on the importance of providing the patients we serve with timely access to care, by our world class interdisciplinary experts within the field of cardiovascular medicine. Hartford HealthCare has embarked on a vision to establish a Heart and Vascular Institute with the primary focus of coordinating care across the continuum. This includes, but is not limited to, complex procedures such as Primary and Elective angioplasty. Patients will benefit from an interdisciplinary approach to care under an integrated care delivery system. This model supports our network affiliate's scope of practice and includes practitioners dedicated to the Institute's goals and objectives. These goals and objectives are aligned with standards of care and best practices across the country. The development of the Heart and Vascular Institute in our East Region is differentiated by offering an extension of the expertise provided by our tertiary care center at Hartford Hospital. The overall goal of providing this service supports the HHC vision of creating a single standard of care in a consistent manner, monitored by a quality control team nationally recognized for expertise in cardiovascular interventions.

Institute Oversight

Hartford Hospital offers an array of comprehensive services and complex procedures in a setting of highly personalized care. Backus will leverage Hartford Hospital's expertise and experience in creating its PCI program, as well as Hartford Hospital's many centers of excellence contiguous with general cardiology, heart failure, and electrophysiology. This will support a comprehensive approach to managing patients with cardiovascular disease requiring intervention. This holistic approach treats the patient comprehensively, and ensures ongoing follow up and care management.

The Interventional team at Hartford Hospital will provide the necessary training, oversight, and backup to ensure a high quality, efficient, and seamless Interventional service at Backus. In addition, the

training requirements and clinical protocols will be the same at both hospitals, managed under the direction of the Institute's physician led quality team. Hartford HealthCare is currently deploying Epic throughout the System. By 2017 all Hartford HealthCare affiliates will be on Epic, which will create availability of clinical information across the healthcare system. Community providers will have the option of joining the Epic platform through Hartford HealthCare's "Community Connect" program, which will allow providers and practices associated with Hartford HealthCare access to the Epic products that are linked to the inpatient and ancillary systems of Hartford HealthCare. This results in delivering the patient and provider a unified patient record within a true community health record. Key benefits of Hartford HealthCare's partnership with Epic are better coordination of patient care, avoidance of duplicative testing and procedures, as well as the ability to measure quality and ultimately manage cost.

Conclusion

A PCI program at Backus Hospital will support the mission and vision of our Hartford HealthCare Heart & Vascular Institute by creating access to care close to home, under the direction of leading experts in the field of cardiovascular medicine. We have recruited world renowned leaders in cardiac surgery, cardiology, and vascular surgery that have elevated the program to regional and national status. The tertiary care center at Hartford Hospital has published academically over 100 studies in endovascular procedures and has been a pioneer in this field. Hartford HealthCare is working to reduce the cost of care to patients having to receive multiple procedures, and to ensure coordinated and streamlined care. For these reasons, I ask you to approval the CON Application and I thank you for your time today.

Good Morning,

Please note the Exhibits in the Pre-Hearing Responses were incorrectly numbered (page 1496, Exhibit 28 should have been 30 and Exhibit 29 should have been 31). Those two typos have been corrected in the attached documents and those are the only two changes that were made to the filing.

I apologize for any inconvenience this may cause.

Best Regards,
Carlene

IN THE MATTER OF:

A Certificate of Need Application by
The William W. Backus Hospital
Notice to Petitioner re: Request for Status

Docket Number: 15-32031-CON

**RULING ON A PETITION FILED BY
LAWRENCE + MEMORIAL HOSPITAL, INC.
TO BE DESIGNATED AS AN INTERVENOR**

By petition dated March 16, 2016, Lawrence + Memorial Hospital, Inc. ("Petitioner") requested Intervenor status in the public hearing to be held by the Department of Public Health ("DPH") Office of Health Care Access ("OHCA") regarding the Certificate of Need ("CON") application of The William W. Backus Hospital ("Applicant") filed under Docket Number: 15-32031-CON.

Pursuant to Connecticut General Statutes § 4-177a, the Petitioner is hereby designated as an Intervenor with full rights of cross-examination at the hearing scheduled for March 23, 2016 at 410 Capitol Avenue, Hartford, Connecticut. As an Intervenor with full rights of cross-examination, the Petitioner may participate as indicated below.

The Petitioner is granted the right to inspect and copy records on file with OHCA related to the CON filed under Docket Number 15-32031-CON and shall be copied on all pleadings, correspondence and filings submitted from this point forward by the Applicant until the issuance of a final decision by OHCA. As an Intervenor with full rights of cross-examination, the Petitioner may be cross-examined by the Applicant and the Petitioner has the right to cross-examine the Applicant. The Petitioner shall file its pre-file testimony by the close of business on March 18, 2016.

OHCA will make any additional rulings as to the extent of the hearing participation rights of the Petitioner throughout the hearing in the interest of justice and to promote the orderly conduct of the proceedings.

DEPARTMENT OF PUBLIC HEALTH	:	
DIVISION OF OFFICE OF	:	
HEALTH CARE ACCESS	:	**DOCKET NO. 15-32031-CON**
	:	
IN RE: ESTABLISH AND OPERATE	:	
A PRIMARY AND ELECTIVE	:	
ANGIOPLASTY PROGRAM AT THE	:	
WILLIAM W. BACKUS HOSPITAL	:	**MARCH 18, 2016**

PRE-FILE TESTIMONY OF BRUCE CUMMINGS

Good Morning. My name is Bruce Cummings and I am the Chief Executive Officer and President of Lawrence + Memorial Hospital, Inc. ("L+M Hospital" or "L+M"). I am here today to speak in opposition of the William W. Backus Hospital (the "Applicant" or "Backus") Certificate of Need ("CON") application (the "Application") to provide primary and elective angioplasty without onsite cardiothoracic surgical backup.

L+M Hospital has been serving the region for over 100 years and has a staff in excess of 2,400 professional, technical and support personnel in nearly every medical specialty. Our mission is to improve the health of our region. In 2008, L+M began offering – and continues to this day to further develop and refine -- a strong quality primary and elective regional angioplasty program to serve patients and to offer a level of care in our service area that meets or exceeds national standards. As with all L+M's services, our angioplasty program is focused on providing innovative, high quality care to the community and we will make every effort to continue to do so. In collaboration with Yale School of Medicine and the Yale New Haven Heart and Vascular Center, L+M has helped lead the way in Connecticut for angioplasty performed at a community hospital.

I am here today to encourage OHCA to deny Backus Hospital's Application. L+M has spent a great deal of time analyzing Backus Hospital's Application and its potential harmful

00001

impact on our angioplasty program. Attached is L+M's work product outlining all of the deficiencies in Backus Hospital's proposed program ("Attachment A"). Detailed in the attachment is Backus Hospital's failure to meet the CON requirements that OHCA has spent years studying and outlining for purposes of determining whether and when complex clinical services, especially primary and elective angioplasty services, are appropriate to offer at a hospital. Backus's proposed angioplasty services will not be in the best interest of patients, Backus or any other hospital in Connecticut. Backus has not demonstrated a clear public need for the proposal in either the made up "Angioplasty Region" or the traditional OHCA-defined service area. The angioplasty services proposed by Backus are duplicative of L+M's existing angioplasty program and will have an adverse impact on L+M's program. As important, Backus proposal is not financially feasible. Based on all of these factors, it is impossible for OHCA to approve Backus Hospital's Application.

Thank you for providing me the opportunity to speak today in opposition of Backus Hospital's Application. Dr. Brian Cambi will speak in detail regarding the clinical deficiencies in the Application, Seth Van Essendfelt will discuss the financial failure of the Application, and Dr. Daniel Rissi will speak to the administrative and operations short comings in the Application. I encourage OHCA to deny the Application.

00002

Attachment A
Summary of L+M's Position

Backus's Failure to Meet CON Requirements regarding establishing Primary and Elective Angioplasty Services

OHCA considers 12 factors when reviewing a Certificate of Need application. These 12 factors are derived from statutory criteria at Conn. Gen. Stat. 19a-639 (a) which states "In any deliberations involving a certificate of need application filed pursuant to section 19a-638, as amended by this act, the office shall take into consideration and make written findings concerning each of the following guidelines and principles:"

(1) Whether the proposed project is consistent with any applicable policies and standards adopted in regulations by the Department of Public Health;[1]

- Backus's application is inconsistent with the professional guidelines OHCA has utilized including in evaluating implementation of PCI services, namely the American College of Cardiology, the American Heart Association and the Advisory Council for Cardiothoracic Surgery.[2] These Guidelines address both primary and elective programs.
    - 2014 ACCF/AHA/SCAI Guidelines **strongly advise against** the development of PCI facilities within a 30-minute emergency transfer time to an established facility. L+M is within 30 minutes of Backus.
    - 2014 ACCF/AHA/SCAI Guidelines state that "multiple low-volume and partial service PCI centers within a geographic area… increased costs for the overall health system and have not been shown to improve access."[3] As applied to a primary PCI-only program or a primary and elective program at Backus, an additional low-volume provider will not improve access.
    - ACCF/AHA/SCAI Guidelines state that "the addition of more PCI centers has not substantially improved access to PCI services for most patients."[4] Approval of primary or elective PCI services at Backus will not improve access for any patients.
    - ACCF/AHA/SCAI state primary PCI is only reasonable in hospitals without on-site cardiac surgery, provided that appropriate planning for program development has been accomplished. Backus has not shown appropriate planning.

---

[4] 2014 SCAI/ACC/AHA Update at 177.

00003

- 2013 ACCF/AHA Guideline for Management of STEMI: "In the absence of contraindications, fibrinolytic therapy should be administered to patients with STEMI at non-PCI-capable hospitals when the anticipated FMC-to-device time at a PCI-capable hospital exceeds 120 minutes because of unavoidable delays (Class I, Level of Evidence B)." Backus did not administer any such therapy confirming that Backus is confident that appropriate transfers can be made.
- ACCF/AHA/SCAI Guidelines conclude that facilities performing under 200 cases are associated with worse outcomes. If Backus introduced angioplasty services, L+M will be performing less cases. Further, Backus does not meet the required case volume in its predictions for the OHCA-defined service area.[5]

- The ACCF/AHA/SCAI Guidelines state "the development of PCI facilities within a 30-min transfer time to an established facility is therefore strongly discouraged."
  - L+M's established primary and elective angioplasty program is a mere twenty-one (21) minutes away from Backus Hospital and is clearly within the recommended thirty (30) minute transfer time.
- The ACCF/AHA/SCAI Guidelines also provide that "primary PCI is reasonable in hospitals without on-site cardiac surgery, provided that appropriate planning for program development has been accomplished" (emphasis added).
  - Backus has not demonstrated appropriate planning including failing to provide an appropriate call coverage proposal.
- Backus's Application is also inconsistent with DPH's report entitled "Hospital Transfers of Emergency Coronary Angioplasty Patients for Elective Surgery or Open Heart Surgery: October 1, 2013 to September 30, 2014"[6]
  - The report states "[t]here is no evidence of unmet need for the provision of PCI in the system; however, there is indication of excess capacity."[7]
  - The report emphasizes declining volumes across the state.[8]
- Backus's Application is also inconsistent with DPH's report entitled "Connecticut EMS Vehicle Equipment List."[9]

---

[5] Application at 1462.

[6] Connecticut Department of Public Health, *Hospital Transfers of Emergency Coronary Angioplasty Patients for Elective Surgery or Open Heart Surgery: October 1, 2013 to September 30, 2014* (January 15, 2015) (hereinafter referred to as "Hospital Transfers"). http://www.ct.gov/dph/lib/dph/ohca/misc/pa_13-208_sec._69_cardiac_transfers_report_final.pdf

[7] *Hospital Transfers* at 8.

[8] *Hospital Transfers* at 8.

[9] Connecticut Department of Public Health, *Connecticut EMS Vehicle Equipment List*, February 10, 2014. Backus improperly relies upon Connecticut EMS STEMI Guidelines put forth by the CT DPH on January 23, 2012. Since 2012, the CT DPH, recognizing the importance of early detection of STEMI patients in field, has expanded the EMT scope of practice to include 12-lead EKG acquisition and transmission in a directive put forth on December 30, 2014. This is a clear indication that the Connecticut Department of Public Health's focus is not on additional PCI sites, but appropriately diagnosing patients with STEMI in the field, pre-hospital, so they can be rapidly treated at the most appropriate location.

- Early detection of STEMI patients in the field should be a priority, not a new primary PCI program.
- Resources allocated to diagnosing patients by EMS in the field is more cost effective than adding another PCI program.

- OHCA has extensively reviewed the implementation of primary and elective PCI programs in Connecticut and Backus's Application does meet the standards.
  - In Docket No. 12-31768, L+M submitted numerous agreements, policies and protocols (e.g. patient selection guidelines, joint quality assurance review process, transfer protocol, surgical backup policy, etc.)
  - Demonstration of clear public need.
  - Evidence demonstrating the services would contribute positively to the quality of health care delivery in the region.

(2) The relationship of the proposed project to the state-wide health care facilities and services plan;

- The Backus proposal is inconsistent with the Statewide Health Care Facilities and Services Plan.
  - The Plan states that "[c]ompetition with another PCI program in the same geographic area, particularly an established program with surgical backup, may not be in the best interest of the community."[10] The proposed services:
    - Compete with L+M;
    - Compete with Hartford Hospital;
    - Compete with St. Francis; and
    - Compete with four (4) out of state hospitals.

    Therefore, the proposed services are not in the best interest of the community.

  - Backus Hospital is currently not performing primary PCI and is not likely to achieve the requisite number of cases listed in the Plan. Applicant has only transferred an average of 70 cardiac catheterization patients per year that were identified as requiring elective PCI.[11]

(3) Whether there is a clear public need for the health care facility or services proposed by the applicant;

- Backus has not demonstrated clear public. L+M has excess capacity.
- OHCA itself through extensive research and reports state: "[t]here is no evidence of unmet need for the provision of PCI in the system; however there is indication of excess capacity."[12]

[10] *Statewide Health Plan* at p. 39.
[11] *Application* at p. 17.
[12] *Hospital Transfers* at p. 8.

00005

- The hospitals listed on p. 46 of the Application that are currently serving the Angioplasty Region are sufficiently addressing the current need.
- L+M maintains a viable angioplasty program in the same geographic area and has no backlog and can accept additional volume.
- L+M's established primary and elective angioplasty program is a mere twenty-one (21) minutes from Backus.
- OHCA's completeness questions acknowledge to the Applicant that angioplasty volumes are trending downward nationally and state-wide.[13]
- The State's health care community is combating heart disease through other initiatives:
    - better control of high blood pressure and high cholesterol,
    - a decline in smoking,
    - improvements in treatments, medication and quality of care[14]
    - the use of statin drugs
    - Backus does not address the use of increased efforts to combat heart disease through methods other than primary and elective PCI.
- Introduction of duplicative angioplasty services at Backus will significantly impact volume and utilization at L+M.
    - L+M is only 17.1 miles away from Backus. 25% of the Angioplasty Region **primary** PCI patients are served at L+M Hospital resulting in a drastic impact to L+M's existing PCI program.[15]
    - Hartford Hospital is 40 miles away from Backus, yet Backus is transferring primary PCI patients to a facility that is double the drive time (Hartford Hospital) further taxing Hartford Hospital's cath lab.[16] L+M has excess capacity to accommodate additional PCI volume. Were Backus to transfer primary PCI patients to L+M instead of Hartford Hospital, L+M could assist in alleviating Hartford Hospital's capacity issues.

[13] "National PCI procedure volume peaked in 2006 and has since dropped 30% because of factors such as increased emphasis on the use of other treatment modalities that include drug eluting stents and medical therapy, improved primary and secondary prevention efforts and reduced incidents of STEMI. Similar to the nation, statewide PIC volumes have been declining over the last seven years (Figure 1). The total number of PIC procedures in Connecticut dropped 20% from 8,966 to 7,154 between FY 2007 and FY 2013."[13] *Hospital Transfers* at p. 8.

[14] "Generally, both primary and elective PCI volumes are declining in the nation and in Connecticut because of increased emphasis on other treatment modalities." *Hospital Transfers* at p. 10.

[15] *Application* at 46.

[16] *Application* at 1536.

(4) Whether the applicant has satisfactorily demonstrated how the proposal will impact the financial strength of the health care system in the state or that the proposal is financially feasible for the applicant;

- Impacting Financial Strength:
  - Hospitals are currently facing serious financial challenges in the current healthcare market.
    - Offering an unnecessary program that is duplicative of existing providers in the service area and that will operate at a large deficit is not appropriate.
    - Drawing patients from other hospitals that adequately meet the primary and elective angioplasty needs of the service area will result in losses for other hospitals already serving the population.
    - This will contribute to a decrease in the overall financial stability of Connecticut's health care delivery system.
    - Staffing angioplasty services and ensuring call coverage and readiness make it a very expensive program to operation. Having excess capacity is not cost effective for a proposed provider or an existing provider of angioplasty services.
- Project is Financially Feasible for the Applicant:
  - The Applicant has stated the services are not financially viable.[17] The program will operate at a projected deficit that will increase every year.[18]
  - The project will require a $4.8-million-dollar investment to upgrade the Backus facilities.[19] Backus is proposing to invest nearly $5 million dollars of scarce capital resources into an unnecessary program that is duplicative of existing providers in the service area and that will continuously operate at a larger deficit each year with no prospective break-even point.
  - Applicant's financial projections are not in line with declining volumes across the state.[20]
  - Applicant submitted insufficient evidence to support the projected volume and utilization.

[17] *Application* at p. 65.
[18] *Application* at p. 1409 (Financial Forms). Deficits are $355,363 in 2016, $457,817 in 2017, $559,701 in 2018 and $705,757 in 2019.
[19] *Application* at p. 67.
[20] *Hospital Transfers* at p. 8.

(5) Whether the applicant has satisfactorily demonstrated how the proposal will improve quality, accessibility and cost effectiveness of health care delivery in the region, including, but not limited to, (A) provision of or any change in the access to services for Medicaid recipients and indigent persons;

- Quality:
    - OHCA recommends that providers and facilities maintain certain utilization levels to ensure providers maintain an appropriate level of experience.[21] Due to the estimated low volume, the proposal will not ensure providers and facilities are properly trained and thus will not improve quality.
    - Full service hospitals that offer open heart surgery need to maintain certain volumes to maintain proficiency. A decrease in volume could result in a decrease in proficiency in other programs, leading to an overall decrease in quality cardiac care in the state.
    - Expert consensus guidelines strongly recommend providing 24/7 on-call PCI capability stating that primary PCI should not be performed at facilities unless it is provided on a 24/7 basis. Backus has not supplied the requested call-coverage schedule to support the guidelines.
- Accessibility:
    - ACCF/AHA/SCAI Guidelines state that "the addition of more PCI centers has not substantially improved access to PCI services for most patients."[22] Approval of primary or elective PCI services at Backus will not improve access for any patients.
    - The Applicant will not improve accessibility of health care delivery. Door to Balloon timing is generally equivalent to that of L+M and other hospitals with PCI capability. The Applicant will not improve accessibility of health care delivery based on improved Door to Balloon time.
        - Offering PCI service at Backus does not result in all patients from the Angioplasty Region receiving PCI services at Backus. Many ambulances bypass certain primary PCI sites for unknown reasons such as referral patterns. Thus, the Door to Balloon time analysis by the Applicant cannot be relied upon.[23]
        - There is no true improvement in time from first medical contact for the proposed program. Whether a patient lives 10 minutes away from Backus or 30, a key rate limiting factor is the time for cath lab team activation and cath lab set-up, which will take 50 minutes to accomplish. Thus access of door to balloon time or lab arrival to device time is not significantly improved for a large majority of the patients living in the made up "Backus Angioplasty Region" due to this team/lab "prep" time.

[21] *Statewide Health Plan* at p. 41.
[22] 2014 SCAI/ACC/AHA Update at 177.
[23] *Application* at p. 34-38.

- Backus's own inadequate response are problematic and do not support a finding of public need. Backus's DIDO time is seventy-three (73) minutes, forty- three (43) minutes over the recommended thirty (30) minute DIDO timeframe. Backus's DIDO time is much worse then other similarly situated hospitals.

- Cost Effectiveness:
  - Duplicate services are not cost-effective. See response to #5.

(6) The applicant's past and proposed provision of health care services to relevant patient populations and payer mix, including, but not limited to, access to services by Medicaid recipients and indigent persons;

- The patient population already has access to these services and there is no public need.
- Backus utilizes a methodology for defining the service area and population that are inconsistent with established OHCA criteria and standards.
- Backus has mischaracterized the regional needs of the "Angioplasty Region" based on age, income, health and other characteristics compared to State and national averages.[24]

(7) Whether the applicant has satisfactorily identified the population to be served by the proposed project and satisfactorily demonstrated that the identified population has a need for the proposed services;

- The Applicant has not satisfactorily identified the population. The Applicant is using its own made up defined service area ("Angioplasty Region") and not the Hospital's historical service area or a recognized OHCA service area.[25] This made up "Angioplasty Region" is irrelevant to both the proposed primary and elective services. Backus's relies upon a consultant, 3d Health, Inc. ("3d"), to derive a contrived service area rather than rely on its own historical patient draw.
  - Backus is anticipating drawing patients outside of its service area. Some of these towns send patients are closer to out of state providers (Worcester, MA). This also creates insufficient evidence to support the projected volumes to support need.
- There is already an existing provider of primary and elective PCI in the service area, L+M, that overlaps with Backus service area. This also creates insufficient evidence to support the projected volumes to support need.
- L+M only realizes a 54% retention rate for patients with STEMI in the market – Backus's projections of 80% are unreasonable.
- The anticipated Angioplasty Region does not account for patients who may want to have elective PCI at a different hospital (for example, Yale or Hartford because they have open heart surgery backup). By the Applicant's own admission, 58% of its Angioplasty Region patients travel to Hartford Hospital or Yale to receive elective PCI.[26]

[24] *Application* at p. 43; 44; 454; 456.
[25] *Application* at p. 37.
[26] *Application* at p. 45.

(8) The utilization of existing health care facilities and health care services in the service area of the applicant;

- Existing health care facilities are satisfactorily meeting the needs of the Backus service area any way the services area is defined, whether pursuant to the OHCA defined service area or the "Angioplasty Region."
    - 11.3% of the Angioplasty Region patients are served at L+M Hospital.[27]
- Backus has not listed any incidents of patient harm based on having to transfer patients to other hospitals.

(9) Whether the applicant has satisfactorily demonstrated that the proposed project shall not result in an unnecessary duplication of existing or approved health care services or facilities;

- Backus's proposed patient population draws patients that are being serviced by existing, OHCA-approved PCI providers (e.g. Hartford Hospital, St. Francis, Yale, L+M) as well as four (4) out of state facilities. Approving PCI services at Backus will result in duplicative services. Additional programs will dilute professional and institutional competencies.
- Applicant fails to acknowledge that volumes are declining for the services being proposed. Backus instead offers bogus information that angioplasty utilization in the "Angioplasty Region" will increase.[28] OHCA directly inquires of Backus to "explain the reasoning for the 24% growth in PCI's (page 69), given declining state and national PCI trends."[29] Backus cannot meet volume requirements without siphoning volume from other existing programs.
- A Connecticut specific decline in volume as documented in the report entitled "Hospital Transfers of Emergency Coronary Angioplasty Patients for Elective Surgery or Open Heart Surgery: October 1, 2013 to September 30, 2014" and prepared by OHCA.
    - The report emphasizes declining volumes across the state.
- Coronary heart disease prevalence has been stable or declining in recent years. According to the CDC, heart disease prevalence declined among US adults from an average of 11.8% in 2001 to 10.9% in 2013. New England adults have a lower rate of heart disease than US adults overall. This rate is similarly stable or declining.
- In addition, the CDC found that the prevalence of heart attacks among US adults declined from 3.5% in 2001 to 3.0% in 2013. The prevalence of heart attacks among New England adults was similarly found to be 3.0% in 2013.[30] See Table attached.
- National angioplasty (PCI) rates are the lowest they have been since 1996, and continue to trend downward. According to the Society for Cardiovascular Angiography and

---

[27] *Application* at p. 46.
[28] *Application* at p. 69; 1444.
[29] Completeness Question 1 (October 30, 2015).
[30] Center for Disease Control ("CDC") Health Data Interactive, 1993-2013, NHIS, Chronic Conditions, ages 18+. Available at http://205.207.175.93/DHI/Tableviewer/tableview/aspx.

Intervention, the American College of Cardiology Foundation, and the American Heart Association in their 2014 Expert Consensus Document, "...the annual volume of PCI procedures peaked in 2006 and has since declined by over 30%."[31] The report cites several contributing factors to the decline:

- Education in restenosis, attributable to drug-eluting stents;
- Rise of medical therapy to treat stable coronary artery disease;
- Growth in primary and secondary prevention efforts;
- Reduction of the incidence of ST-segment elevation myocardial infarction (STEMI); and
- Development and application of appropriate use criteria for implementation of PCI services.

(10) Whether an applicant, who has failed to provide or reduced access to services by Medicaid recipients or indigent persons, has demonstrated good cause for doing so, which shall not be demonstrated solely on the basis of differences in reimbursement rates between Medicaid and other health care payers;

- Not applicable.

(11) Whether the applicant has satisfactorily demonstrated that the proposal will not negatively impact the diversity of health care providers and patient choice in the geographic region; and

- L+M will be dramatically impacted and harmed by the introduction of duplicative services.
  - Proposed PCI services must demonstrate a low likelihood of causing the annual primary or elective PCI volume to fall below the minimum standard at an existing PCI facility. Backus's proposal does not demonstrate that it will not impact existing providers. Backus' proposal will be duplicative to L+M's existing primary and elective angioplasty program and will hinder L+M's ability to provide high quality cost efficient services. Backus will siphon volume from L+M's program.
- L+M will have a negative financial impact as a result of the proposed program.

(12) Whether the applicant has satisfactorily demonstrated that any consolidation resulting from the proposal will not adversely affect health care costs or accessibility to care.

- Backus has stated this will not be a profitable endeavor and Backus Hospital may pass costs onto patients.
- "Cardiac expert's guidelines recommend that to maintain competency, physicians must perform PCI procedures at high volume institutions; this has an impact on PCI referral

[31] Laslatt LJ, Alagona P, Clark BA, et al. The worldwide environment of cardiovascular disease: Prevalence, diagnosis, therapy, and policy issues. J Am Coll Cardiol 2012; 60:S1-49.

patterns"[32] because providers feel pressure to keep certain institutional volumes up. This type of result could adversely drive up health care costs for payors and patients. The introduction of an additional, unnecessary elective and primary angioplasty program into the service area could result in undermining the quality of care at each hospital in the service area.

Backus has not demonstrated a clear public need for primary or elective angioplasty services. Accepted medical literature highlights that there is no need for primary or elective PCI services because they do not improve access for patients. Backus will not reach the recommended volume for a primary and elective program nor will it have the volume for a primary program alone. Backus has not followed impatient data to establish its service area, but has rather contrived its own immaterial service area. There is no gap in access to primary or elective angioplasty services for patients in Backus's Angioplasty Region or Backus's OHCA-defined service area.

For all of the foregoing reasons, the Backus Application should be denied. Based on the statewide decline at all Connecticut providers of angioplasty, the speculative projected new cases, and the fact that there are existing providers currently providing primary and elective angioplasty services in the proposed service area and these providers have the capacity to fulfill the primary and elective angioplasty needs of the community, OHCA should find that there is access to primary and elective angioplasty services for residents within Backus's service area, and further, Backus fails to demonstrate and provide evidence of a clear public need for this proposal. Based on the lack of sufficient evidence demonstrating that the Applicant's proposed project fulfills a clear public need for primary or elective angioplasty, OHCA should conclude that the financial projections and volumes upon which these services are based are not reasonable nor achievable, and that the project is not financially feasible. We respectfully request that the Backus Application be denied.

Present Position

Lawrence + Memorial Healthcare – New London, CT
President and Chief Executive Officer 2005 – Present

Key accomplishments:
- Led acquisition of Westerly Hospital (Westerly, RI) in 2013
- John D. Thompson Award and Community Service Award from the Connecticut Hospital Association
- L+M named one of the state's 20 best places to work by Connecticut Magazine

Previous Positions

Olean General Hospital – Olean, New York
President and Chief Executive Officer 2002 – 2005

Blue Hill Memorial Hospital – Blue Hill, Maine
Chief Executive Officer 1990 – 2002

Mid-Maine Medical Center – Waterville, Maine
Vice President, Strategic Planning, Marketing and Corporate Development 1985 – 1990
Director of Ambulatory Care 1980 – 1985

City of Danbury – Danbury, Connecticut
Director of Health 1978 – 1980

Education

M.P.H - Yale University School of Medicine, Department of Epidemiology and Public Health 1977

B.A. - Colby College 1973

Professional Affiliations and Associations

American College of Healthcare Executives (Fellow)
Connecticut Hospital Association, Board of Directors, Chair (2014-2016)
Visiting Nurse Association of Southeastern Connecticut, Director
American Hospital Association, Regional (New England) Policy Board, Delegate
Sea Research Foundation, Board of Directors

IN RE: ESTABLISH AND OPERATE	:	
A PRIMARY AND ELECTIVE	:	
ANGIOPLASTY PROGRAM AT THE	:	
WILLIAM W. BACKUS HOSPITAL	:	**MARCH 18, 2016**

PRE-FILE TESTIMONY OF BRIAN CAMBI, M.D.

Good Morning. My name is Dr. Brian Cambi and I am the Medical Director of the Lawrence + Memorial Hospital, Inc. ("L+M Hospital" or "L+M") Heart and Vascular Center in affiliation with Yale-New Haven Hospital ("YNHH"). I am here today to speak in opposition of the William W. Backus Hospital (the "Applicant" or "Backus") Certificate of Need ("CON") application (the "Application") to provide primary and elective angioplasty without onsite cardiothoracic surgical backup.

My professional background is described in the Curriculum Vitae attached as Exhibit A to my testimony. Briefly, I am a graduate of SUNY Buffalo School of Medicine and completed my postgraduate and fellowship training in cardiology and interventional cardiology at YNHH. I am board certified in Cardiology and Interventional Cardiology, as well as Nuclear Cardiology and Echocardiography.

Since 2008, I have served as the Medical Director of the L+M primary angioplasty program, and now currently hold the position of Medical Director of the L+M Heart and Vascular Center. I reside in East Lyme, CT and 80% of my time is spent clinically or administratively supporting L+M Hospital. One day per week, or 20% of my time, I spend at YNHH completing complex angioplasty procedures. My remarks today address the clinical and

quality aspects of Backus's Application. Specifically that there is (i) no clear public need, (ii) L+M Hospital is equipped to serve the patients of the geographic region safely and without concern including via transfer from Backus to L+M , (iii) Backus's proposal is inconsistent with guidelines adopted by OHCA for primary and elective angioplasty programs, (iv) that the addition of another angioplasty program in the geographic area will negatively affect the current care provided to patients, and (v) adding new angioplasty services to the geographic area will provide no improvement in quality, rather it may lead to a decline in quality.

I. No Clear Public Need Has Been Established Based on Clinical Factors

L+M Hospital currently offers an existing primary and elective angioplasty program that meets the needs of the service area as defined by OHCA and has the clinical capacity to accept additional patients. Patients benefit from the existing experience of the L+M Hospital angioplasty providers and supporting clinical staff (e.g., CCU and telemetry nurses).

A. L+M Hospital Already Maintains a Viable Program in the Same Geographic Area

L+M Hospital has a well-established angioplasty program that provides both primary and elective angioplasty to patients in the geographic area described as the Backus Hospital's "Angioplasty Region." Since the establishment of L+M Hospital's primary angioplasty program in 2008 and the elective program in 2013, L+M Hospital has performed over 700 primary angioplasties and over 280 elective interventional procedures. L+M Hospital's clinical affiliation with YNHH remains strong.

In my career to date, I have performed over 1,000 angioplasty cases with a high success rate and low complication rate. I am also a Yale School of Medicine ("YSM") clinician and faculty member, as are and all interventional cardiologists that cover L+M Hospital's angioplasty

program. Communication and emergent transport between L+M Hospital and YNHH, when needed, has been seamless. Additionally, L+M Hospital has thoughtfully and methodically invested in the equipment and personnel to ensure a sustainable and reliable program to the patients in eastern Connecticut. Such investments include recent and upcoming upgrades to each of L+M Hospital's two catheterization laboratories to ensure state-of-the-art equipment, as well as completing a quarterly CME-qualifying lecture series designed to educate L+M Hospital staff (e.g., physicians, nurses, technicians, and sonographers) through presentation of latest national standards for clinical guidelines and L+M-specific medical case review.

B. L+M Hospital has Capacity for Additional Volume

L+M Hospital has sufficient clinical capacity for additional volume. L+M Hospital has no backlog and has the staff and resources to provide additional angioplasty services. As noted previously, L+M has two catheterization suites to accommodate patients. L+M's established primary and elective angioplasty program is a mere twenty-one (21) minutes away from Backus and has angioplasty resources and staff available consistent with national standards ACCF/AHA/SCAI Guidelines[1]. The Applicant wholly ignores this fact and offers immaterial evidence about patient origin distance from L+M Hospital to distract from the fact that L+M Hospital is a qualifying transfer location for Backus.

C. Patients are Better Served Being Transported to L+M

Clinical outcomes are not affected when patients are transported within the appropriate timeframe. L+M Hospital is the closest PCI-capable hospital to Backus. For STEMI patients presenting at Backus directly, Backus has ample time to transfer patients to L+M for immediate

[1] *"ACCF/AHA/SCAI Guideline for Percutaneous Coronary Intervention; a Report of the American College of Cardiology Foundation/American Heart Association Task Force on Practice Guidelines and the Society for Cardiovascular Angiograph and Interventions,"* as updated and amended (the "ACCF/AHA/SCAI Guidelines").

PCI within the recommended timeframe of 120 minutes per the 2013 ACCF/AHA Guideline for the Management of ST-Elevation Myocardial Infarction. According to such guidelines, "immediate transfer to a PCI-capable hospital for primary PCI is the recommended triage strategy for patients with STEMI who initially arrive at or are transported to a non-PCI-capable hospital, with an FMC-to-device time system goal of 120 minutes or less." Backus cites its long door-in-door-out ("DIDO") time and inter-facility transfer times as a factor in being unable to meet this standard. However, despite being the closest PCI-capable provider, to date, only a limited number of STEMI transfers from the Backus ED are received at L+M. Since 2010, there were a total of three (3) transfers from Backus Hospital to L+M for emergent angioplasty. Of those three (3) cases, two (2) were only transferred to L+M because there was a large snowstorm at the time in January of 2015. To Backus's credit, they transferred these patients to L+M because it was in the patients' best interest because L+M is the closest PCI-capable hospital.

Were Backus to reduce its DIDO times and transfer patients to L+M, STEMI patients presenting first at Backus are well-positioned to receive their device at L+M within recommended timeframes. According to L+M's latest ACC-NCDR quality report, in the last rolling four (4) quarters ending 2015Q3, L+M's "median time from ED arrival at STEMI transferring facility to immediate PCI at STEMI receiving facility among transferred patients (in minutes)" was 89 minutes. These transfers were from Westerly Hospital (Westerly, RI) to L+M, with a travel time of twenty-seven (27) minutes. Given the previously mentioned travel time of 21 minutes between Backus and L+M, it is highly probable that transferred STEMI patients will receive immediate PCI well within the stated 120 minute threshold, and potentially even under 90 minutes were Backus to send primary angioplasty cases to L+M versus alternate and further facilities.

Backus continues to misquote and misuse the AHA/ACC STEMI Guidelines as it relates to 90 minutes versus 120 minute DTB time.[2] For non-PCI capable facilities, the time to device is 120 minutes, not the 90 minutes Backus continues to quote. The 90 minute DTB time in the Guidelines is recommended for PCI-capable facilities.

L+M should be the receiving PCI-capable facility for STEMI patients presenting at the Backus ED as travel times are minimal, and L+M has demonstrated its ability to not only meet, but far exceed clinical recommendations for time to device for transferred patients.

D. No Clinical Benefit to Backus Obtaining Primary PCI

Even if Backus were to have a primary PCI program, patients in the "Angioplasty Region" will not receive a faster time to device.

Backus's proposal relies heavily on travel or drive time analyses, suggesting that a primary PCI program at Backus will improve time-to-device for patients in the "Angioplasty Region." This contention is misguided, and can be disproved by the very data and information provided by Backus in its CON application. Backus states that when activated from the field, the "Cath Lab Team Activation" and "Cath Lab Setup" time will take approximately 50 minutes to complete.[3] Thus, even if EMS's transfer time to Backus is short, patients cannot undergo PCI at any time prior to the 50-minute time period elapsing. In every scenario for Backus, 50 minutes is the very minimum time it takes before the procedure can even occur. Similar to Backus, existing PCI providers all receive field/EMS activation prior to the patient's arrival. As existing providers are all located less than 45 minutes from the towns in the "Angioplasty Region," the transfer time to the receiving hospital is occurring concurrently to the "cath lab readiness."

[2] Application at 48;1534.
[3] Application at 477.

As shown in the table below, 42% of the population in the "Angioplasty Region" is located within a thirty (30) minute drive time of an existing PCI provider and 85% are within a thirty-five (35) minute drive time of an existing PCI provider.

Travel time to Nearest PCI facility for Towns in Angioplasty Region (in-state or out-of-state facilities)				
	≤ 30 minutes	31-35 minutes	36-40 minutes	41-45 minutes
Number of Towns	11	11	2	2
Town Names	Bozrah Colchester Columbia Franklin Hebron Lisbon Norwich Preston Putnam Sprague Thompson	Canterbury East Haddam Griswold Killingly Lebanon Plainfield Pomfret Sterling Voluntown Windham Woodstock	Brooklyn Mansfield	Chaplin Hampton
Total Population	107,110	109,858	34,362	4,211
% of Angio Region	41.9%	43.0%	13.4%	1.6%

Thus, even patients in the most remote locations of the "Angioplasty Region" will arrive at a PCI facility within 45 minutes, 5 minutes prior to the cath lab readiness being complete. And for a large majority of the "Angioplasty Region," transfer to a PCI-capable hospital will occur in less than 35 minutes. There is no marked improvement in time-to-device were Backus to have a primary PCI program because of the time-to-activate and setup the cath lab. This 50-minute duration negates any clinical benefit of a reduced transfer time.

E. Backus Includes Improper Procedures in its Calculations for Public Need

Additionally, Backus includes ICD-9 procedure code 17.55 (transluminal coronary atherectomy) in its analysis and projections of PCI volume. Although indeed a PCI procedure, the SCAI/ACC/AHA Expert Consensus Document: 2014 Update on PCI Without On-Site

Surgical Backup[4] very clearly states that, "rotational or other atherectomy devices…should not be performed in facilities without on-site surgery." Performing these procedures at Backus, a facility without onsite cardiothoracic surgery backup, runs counter to the latest clinical guidelines and will put patients at risk if performed. Thus, Backus's inclusion of the procedure attributed to ICD-9 code 17.55 is not appropriate in justifying public need for a PCI program and projections of volume for this procedure should not be included and in fact are not suitable for facilities without onsite surgery per the most recent clinical guidelines.

F. Backus Fails to Acknowledge Availability of Air Ambulance Transfer

Further, there are ample air ambulance services available in the area. Backus has a LIFE STAR helicopter stationed at its campus. Backus is the only hospital in Windham or New London counties to have an on-site air ambulance and a trauma center. LIFE STAR operates 24 hours a day, seven days a week. Backus states on its website that "[e]mergent transfers can occur in less than an hour via LIFE STAR, which is stationed at Backus."[5] Pursuant to a Hartford Healthcare publication, the travel time between Norwich and Hartford is only 17 minutes.[6]Pursuant to Hartford Hospital data, 25% of LIFE STAR transfers are for cardiac cases.[7] This shows there is already a heavy reliance on LIFE STAR to improve the travel time for cardiac patients to a hospital with full open heart services.

Backus has not included any travel time statistics in its Application regarding the use of the LIFE STAR helicopter. For patients who are already travelling more than 30 minutes to Backus (e.g. East Haddam, Hampton, Pomfret, Putnam, Thompson, Woodstock[8]), the total time

[4] Dehmer GJ, et al. SCAI/ACC/AHA expert consensus document: 2014 update on percutaneous coronary intervention without on-site surgical backup. J Am Coll Cardiol 2014; 63:2624-41.

[7] http://www.harthosp.org/lifestar/FAQs/default.aspx (accessed March 7, 2016).
[8] Application at 36.

to balloon may be decreased by using LIFE STAR. However, Backus does not include these advantages of LIFE STAR in its Application. Without these statistics, Backus has not accurately identified the most effective transfer for certain patients or their respective transfer times. Backus has also failed to acknowledge other hospital campuses that have the capability to accept LIFE STAR transfers, including L+M Hospital. Without Backus including the use of LIFE STAR in its analysis, Backus has failed to appropriately analyze transfer time requirements.

II. Backus's Proposal is Inconsistent with Guidelines Adopted by OHCA

The Applicant's arguments are inconsistent with benchmarks and standards adopted by OHCA through its adoption of the ACCF/AHA/SCAI Guidelines. Such standards are developed by clinical experts in the field and serve as the guiding resource for determining the appropriateness of implementation of these programs. Backus's proposal invokes many problems cited by the ACCF/AHA/SCAI Guidelines including the development of duplicative services and inappropriate planning.

A. The Proposal is not Consistent with Transfer Time Guidelines

The proposal is inconsistent with 2014 ACCF/AHA/SCAI Guidelines that strongly advise against the development of PCI facilities within a 30-minute emergency transfer time to an established facility stating specifically that "if the transfer time is ≤30 minutes, it is reasonable to assume that transfer to the nearest PCI center will provide reperfusion as rapidly as if it were available at the first hospital...*The development of PCI facilities within a 30-min transfer time to an established facility is therefore strongly discouraged*" (emphasis added).[9] L+M's established primary and elective angioplasty program is a mere twenty-one (21) minutes away from Backus

[9] Dehmer GJ, et al. SCAI/ACC/AHA expert consensus document: 2014 update on percutaneous coronary intervention without on-site surgical backup. J Am Coll Cardiol 2014; 63:2624-41.

and is clearly within the recommended thirty (30) minute transfer time. Thus Backus's proposal undoubtedly contradicts the latest recommendations from SCAI/ACC/AHA, a recommendation put forth to stem the proliferation of PCI programs where such implementation will have an adverse impact on the volume of existing established providers and quality of care.

B. The Proposal is Not Consistent with Planning Guidelines

The ACCF/AHA/SCAI Guidelines also provide that "primary PCI is reasonable in hospitals without on-site cardiac surgery, *provided that appropriate planning for program development has been accomplished*" (emphasis added). In the same report, elective PCI in hospitals without onsite cardiothoracic surgical backup was elevated from Class III to Class IIb (Level of Evidence: B), with the same stipulation regarding appropriate planning. These 2011 recommendations were reiterated in the ACCF/AHA/SCAI 2013 Update of the Clinical Competence Statement on Coronary Artery Interventional Procedures Guidelines. Backus's proposal does not comply with either the 2011 or the 2013 recommendations as Backus has failed to demonstrate appropriate planning for its proposed PCI program.

Backus has not provided OHCA, even upon OHCA's request, with the "proposed on-call system to ensure continuous 24/7 coverage" and the "on-call schedule for the physicians that will provide coverage" for the primary PCI program.[10] Instead, Backus stated "until the program is approved by OHCA a detailed on-call system for the Backus program will not exist."[11] In lieu of a call coverage proposal, Backus provided OHCA with the on-call schedule for Hartford Hospital. It should be noted that in L+M Hospital's CON application in 2004 to establish a primary PCI program, L+M provided a call schedule to OHCA, and detailed the physicians involved, and coverage time for local cardiologists versus those from YSM. The lack of a

[10] Application at 1467.
[11] *Id.*

Backus call coverage schedule suggests significant planning deficiencies, those the ACCF/AHA/SCAI has warned against for facilities attempting to initiate PCI programs.

Personnel recommendations outlined in the 2011 and reiterated in the 2014 ACCF/AHA/SCAI expert consensus reports state that PCI programs without onsite cardiothoracic surgical backup include "experienced nursing and technical laboratory staff with training in interventional laboratories." Backus's assertion that "radiology technical staff experience [in interventional radiology lab] with peripheral angioplasty and stenting will complement a Primary and Elective PCI program" is not valid.[12] Although technically similar, vascular angioplasty and stenting procedures and experience in the IR lab does not translate seamlessly into competence for coronary angioplasty and stenting procedures. In addition to the clear anatomical differences, the circumstances surrounding an emergent coronary event and associated patient monitoring (e.g., heart rhythm, blood pressure) are not factors in vascular procedural work that is largely elective and non-emergent. Thus to equate interventional vascular lab experience with coronary cath lab experience is misguided. Aptitude in coronary procedures, particularly for patients with STEMI, is "learned" through formal training and real-world experience. As noted in their CON application, Backus has not cared for a STEMI victim onsite in years. All patients have been transferred and no fibinolytic therapy dispensed. For this reason, Backus's ancillary staff such as cardiac nurses, intensive care nurses, echo techinicians, etc. are not accustomed to treating these patients or providing routine post-care. Backus has not adequately outlined a plan to educate staff on caring for these complex patients.

In my opinion, practice staffing for primary or elective PCI procedures at a community hospital like L+M or Backus is two nurses and one tech. Backus's proposed staffing model

[12] Application at 21.

includes two techs and one nurse which may impact the quality of care provided as an improper level of clinical providers will be available.[13] Backus's personnel recommendations and lack of call coverage plan suggest program planning to-date is lacking and inappropriate. Backus also fails to designate a director to coordinate and operate the program. As such, Backus does not conform to best practice, nor does it comply with ACCF/AHA/SCAI guidelines.

C. The Proposal is Not Consistent With Treatment Guidelines

Additionally, for patients with STEMI, it is commonly accepted that the preferred treatment is PCI versus medical or fibinolytic therapy for most patients. However, use of fibrinolytic therapy (or thrombolytics) is the recommended treatment protocol for patients presenting at non-PCI-capable hospitals under certain circumstances. According to the 2013 ACCF/AHA Guideline for Management of STEMI: "In the absence of contraindications, fibrinolytic therapy should be administered to patients with STEMI at non-PCI-capable hospitals when the anticipated FMC-to-device time at a PCI-capable hospital exceeds 120 minutes because of unavoidable delays (Class I, Level of Evidence B)."[14] Backus's proposal states there were zero (0) doses of fibrinolytic therapy or thrombolytic medication dispensed in FY 2014 to patients presenting with STEMI (Backus CON, Page 104). As a non-PCI-capable hospital, failure to use fibrinolytic therapy or thrombolytic medication on any patient suggests Backus and its health care providers were confident patients could be transferred to PCI-capable hospitals and receive their device procedures within the recommended timeframe of 120 minutes noted above. If such treatment decisions were made, it does not follow that it is clinically necessary that Backus provide primary angioplasty services.

---

[13] *Application* at 84.

[14] O'Gara PT, Kushner FG, Ascheim DD, et al. 2013 ACCF/AHA Guideline for the Management of ST-Elevation Myocardial Infarction: A Report of the American College of Cardiology Foundation/American Heart Association Task Force on Practice Guidelines. J Am Coll Cardiol. 2013;61(4):e78-e140. doi:10.1016/j.jacc.2012.11.019.

D. The Proposal is Not Consistent with Volume Requirements

In 2013, clinical guidelines from the ACCF/AHA/SCAI concluded there is a volume-quality relationship at institutions performing less than 200 PCIs annually. The report states: "An institutional volume threshold <200 PCIs annually appears to be consistently associated with worse outcomes, but above this level, there is no relationship between even higher annual volumes and improved outcomes. Accordingly, the writing committee recommends a minimum institutional volume threshold of 200 PCIs per year."[15] The 2014 SCAI/ACC/AHA Expert Consensus Document on Percutaneous Coronary Intervention Without On-Site Surgical Backup referenced earlier reaffirmed these recommendations for institutional volume, as did the CT DPH Hospital Transfer Report referenced earlier.[16] Although these recent clinical guidelines have now documented proof of the volume-quality relationship, published guidelines before 2013 stressed the importance of maintaining 200 cases. With this understanding, L+M has strived to complete 200 cases minimally between its primary and elective PCI program even before the 2013 and 2014 guidelines were produced.

In FY 2015, L+M performed 216 total coronary interventional cases.[17] As represented in Backus's application, in FY 2015 alone, 32 PCI cases at L+M originated from patients who reside within Backus's "Angioplasty Region."[18] Backus also represents that 51 PCI cases (28 primary PCI and 23 elective PCI cases) at L+M originated from patients who resided within Backus's OHCA-defined service area, representing a 23.6% portion of L+M's total PCI volume.[19] Loss of this volume to Backus will reduce L+M's volume to well below the 200

---

[17] During 2015, 184 cases were angioplasty procedures and 32 cases were diagnostic interventions (e.g., FFR and IVUS).
[18] Application at 1464.
[19] Application at 1458.

threshold. L+M is striving to meet clinical guideline volume requirements and is improving each year. If L+M were to fall well below the threshold, quality indicators at L+M may be impacted.

In addition, per the Agreed Settlement with OHCA signed in 2013, OHCA has been monitoring the L+M program closely. L+M is required on a quarterly basis to submit volume by patient town, as well as its quality dashboard tracked and produced by the ACC-NCDR. L+M is just barely three (3) years into full operation of its elective program, and is not even half way through OHCA's monitoring timeline of seven (7) years. It is the expectation of OHCA per the Agreed Settlement that L+M perform a quantity of procedures higher than those recommended by the ACC, thus because L+M is likely to fall well below the minimum threshold with Backus's program in place, approval of Backus's CON by OHCA will lead to the inability of L+M to meet the requirements of the Agreed Settlement between OHCA and L+M.

E. Backus Improperly Relies on Obsolete Guidance

Backus improperly relies upon Connecticut EMS STEMI Guidelines put forth by the CT DPH on January 23, 2012. Since 2012, the CT DPH, recognizing the importance of early detection of STEMI patients in field, has expanded the EMT scope of practice to include 12-lead EKG acquisition and transmission in a directive put forth on December 30, 2014. This is a clear indication that the Connecticut Department of Public Health's focus is not on additional PCI sites, but appropriately diagnosing patients with STEMI in the field, pre-hospital, so they can be rapidly treated at the most appropriate location. Similarly, initiatives like the American Heart Association's Mission Lifeline have focused on collaboration among PCI-receiving hospitals, PCI-referring hospitals, and EMS to ensure STEMI patients receive care in a timely fashion. As stated in the literature, "since 2000, there has been a substantial decline in the incidence of

STEMI and there is now greater emphasis on developing systems of care for STEMI patients as promoted in the Mission Lifeline initiative."[20]

III. The Proposal Will Result in Unnecessary Duplication of Existing Services Which Can Negatively Affect the Current Care Provided to Patients

Approving this proposal will add an identical service to the same geographic and may negatively affect the current care provided to patients.

A. Applicant Fails to Acknowledge that Volume is Declining

The Applicant fails to acknowledge that utilization is not expected to rise in the Angioplasty Region and instead offers inaccurate information that angioplasty utilization in the "Angioplasty Region" will increase. The Applicant fails to recognize that the health care community is combating heart disease through preventative methods including better control of high blood pressure and high cholesterol and smoking cessation, and fails to address the improvements in treatments, medication and quality of care.[21] The use of statin drugs and other non-interventional treatments will contribute to continuing declines of primary and elective angioplasty volumes. These factors are not minor – they represent significant changes in the provision of cardiac care that have directly impacted the amount of angioplasty procedures nationwide and in Connecticut. By failing to address the use of increased efforts to combat heart disease through methods other than primary and elective angioplasty, Backus has failed to properly and clearly identify the needs of the proposed service area.

[20] Dehmer GJ, et al. SCAI/ACC/AHA expert consensus document: 2014 update on percutaneous coronary intervention without on-site surgical backup. J Am Coll Cardiol 2014; 63:2624-41.
[21] "Generally, both primary and elective PCI volumes are declining in the nation and in Connecticut because of increased emphasis on other treatment modalities." *Hospital Transfers* at p. 10.

B. The Service Area is Already Appropriately Served

The service proposed by the Applicant is duplicative because patients in the "Angioplasty Region" are already being adequately served. Backus is not the closest or similarly close provider to seven (7) towns in the Angioplasty Region (Hebron, Killingly, Montville, Pomfret, Putnam, Thompson, and Woodstock). See Attachment B and Attachment C. Pomfret, Putnam, Thompson, and Woodstock are all closer to UMass Memorial Medical Center (UMass) located in Worcester, Massachusetts. Nine (9) other towns in the Angioplasty Region are already within 30 minutes travel time of an existing PCI provider (towns include Bozrah, Colchester, Columbia, Franklin, Hebron, Lisbon, Norwich, Preston, and Sprague). Patients' needs in these above towns are already being met. Two (2) towns not included in the "Angioplasty Region," but part of Backus's primary service area as defined by OHCA, are already within 30 minutes of an existing primary PCI provider (towns include Ledyard and Montville). Patients' needs in these two towns are already being met. The other 13 towns in the self-defined "Angioplasty Region" are within 31-45 minute drive time of an existing PCI provider (towns include Brooklyn, Canterbury, Chaplin, East Haddam, Griswold, Hampton, Killingly, Lebanon, Mansfield, Plainfield, Sterling, Voluntown, and Windham). Patients' needs for elective or primary angioplasty in every one of these towns are already being met.

IV. The Addition of Another Angioplasty Program in The Geographic Area Will Negatively Affect the Current Care Provided to Patients

The addition of any angioplasty services in the same service area of L+M Hospital's existing primary and elective program will provide no improvement in quality. Rather, it may lead to a decline in quality as evidenced by national standards. Further, angioplasty providers

may be pressured to improperly refer patients to low-volume centers which may lead to bad quality outcomes.

A. L+M Hospital Meets the Angioplasty Needs of the Service Area and Will Be Negatively Impacted if an Additional Service is Introduced

L+M Hospital's existing primary and elective angioplasty program meets the needs of all patients of Backus Hospital as it is within the recommended transfer time. Patients are better served at existing facilities as there is no benefit to competing programs within the same geographical region. The addition of a program well within a thirty (30) minute transfer time from Backus Hospital is redundant and against the directives of the established ACCF/AHA/SCAI Guidelines adopted by OHCA and by the cardiology community as a whole. Backus's proposed primary and elective angioplasty program will be in direct competition with "another PCI program in the same geographic area" (L+M Hospital). This is against OHCA's guidelines on the development of new angioplasty programs and is not consistent with the Statewide Health Plan nor is it "in the best interest of the community."[22] As such, competition with L+M's program is not in the best interest of the community. Backus incorrectly states it will not affect existing programs even though L+M Hospital is in Backus's geographic area and serves a large portion of angioplasty patients from Backus's service area. It is highly unlikely that Backus may reach its projected utilization figures based on everything that has been presented in the Application and as outlined in OHCA's careful questions. Backus may be offering a disservice to the residents of this state by directing scarce resources to a program that,

[22] *Statewide Health Plan* at 39.

because it will not meet the minimum utilization required of facilities, will offer more harm than benefit. Adding this proposed program at Backus will compromise patient care.

B. Introduction of Additional Duplicative Services Will Undermine the Quality of Care

Existing health care facilities, including L+M Hospital, are satisfactorily meeting the needs of the Backus service area. An additional angioplasty program is unnecessary. The introduction of another duplicative elective and primary angioplasty program in this region will result in undermining the quality of care at each hospital that offers the same services. Cardiac physicians in Connecticut perform angioplasties at various locations – to add an additional location for these providers without a clear benefit to the public is harmful to patients. Specifically, "[c]ardiac experts guidelines recommend that to maintain competency, physicians must perform PCI procedures at high volume institutions; this has an impact on PCI referral patterns"[23] Although Backus states proposed participating providers are high-volume, seasoned PCI providers,[24] Backus contradicts itself by stating it will be recruiting additional providers, whose credentials are unknown, and also fails to incorporate that a physician recently out of fellowship will be included in the rotation.[25] "[I]t is unwise for a newly trained interventional cardiologist to start a new PCI program."[26]

C. Additional Programs Will Dilute Professional and Institutional Competencies

Competencies are achieved and maintained at L+M solely through the primary and elective programs, and are greatly enhanced through the increased number of cases now completed at L+M. Likewise, other departments and clinical areas that "touch" the patient also

[23] *Hospital Transfers* at 9.
[24] Application at 1462.

benefit by increased volume including the inpatient units and staff who house post-procedure patients after either an primary or elective case. Backus's program will not improve quality of health care delivery in the region, but will in fact be harmful to L+M's program by reducing volume and the experience attained by all providers of care.

V. Conclusion

In conclusion, Backus's proposal is not clinically appropriate and should be denied because (i) no clear public need has been established as L+M Hospital is equipped to serve the patients of the geographic region safely and without concern including via transfer from Backus to L+M Hospital; (ii) Backus's proposal is inconsistent with guidelines adopted by OHCA; (iii) the Applicant's proposal does not meet national standards established for primary or elective angioplasty programs; (iv) the addition of another angioplasty program in the geographic area will negatively affect the current care provided to patients; and (v) adding new angioplasty services to the service area will not result in improved quality, rather it may lead to a decline in quality. This application should be denied as it does not meet the same parameters as other angioplasty CONs in Connecticut.

Thank you for this opportunity to speak today. I welcome any questions.

CV

CURRICULUM VITAE

Date of Revision: 2/1/16

Name: Brian C. Cambi M.D. FACC FSCAI

Education:

B.S.	The College of William and Mary (Biology) 1995 - Magna Cum Laude
M.D.	SUNY at Buffalo School of Medicine and Biomedical Science 1999 - Summa Cum Laude

Career/Academic Appointments:

1999-02	Intern and Resident, Internal Medicine, Yale-New Haven Hospital, New Haven, CT
2002-03	Chief Resident, Internal Medicine, Yale-New Haven Hospital, New Haven, CT
2003-06	Cardiology Fellow, Yale University School of Medicine, New Haven, CT
2006-07	Interventional Cardiology Fellow, Yale University School of Medicine, New Haven, CT
2007-08	Clinical Instructor, Dept. of Internal Medicine, Section of Cardiology, Yale University School of Medicine, New Haven, CT
2008-present	Assistant Professor, Dept. of Internal Medicine, Section of Cardiology, Yale University School of Medicine, New Haven, CT

Administrative Positions:

2008-2012	Director, Yale primary angioplasty program at L+M Hospital, Yale University School of Medicine, New Haven, CT
2013-present	Medical Director, Yale New Haven Heart and Vascular Center at Lawrence and Memorial Hospital

Board Certification:

American Board of Internal Medicine, Cardiovascular disease 2006
American Society of Echocardiography, Echocardiography 2006
American Society of Nuclear Cardiology, Nuclear Cardiology 2006
American Board of Internal Medicine, Interventional Cardiology 2007

Professional Honors & Recognition:

International/National/Regional

1999: Summa Cum Laude, Doctor of Medicine, SUNY at Buffalo School of Medicine
1999: The John Watson Award in Medicine
1999: Association of Pathology Chairs Award
1998: Alpha Omega Alpha Honor Medical Society
1997: James Gibson Anatomical Honor Society
1995: Phi Sigma National Honor Society
1995: Magna Cum Laude, Bachelor of Science, The College of William and Mary

Professional Organizations:

American College of Cardiology
2008-present Member, Fellow

Society for Cardiovascular Angiography and Interventions
2008-present Member, Fellow

IN RE: ESTABLISH AND OPERATE	:	
A PRIMARY AND ELECTIVE	:	
ANGIOPLASTY PROGRAM AT THE	:	
WILLIAM W. BACKUS HOSPITAL	:	**MARCH 18, 2016**

PRE-FILE TESTIMONY OF DANIEL RISSI, M.D.

Good Morning. My name is Dr. Daniel Rissi and I am the Vice President and Chief Medical and Clinical Operations Officer at Lawrence + Memorial Hospital, Inc. ("L+M Hospital" or "L+M"). I am here today to speak in opposition of the William W. Backus Hospital (the "Applicant" or "Backus") Certificate of Need ("CON") application (the "Application") to provide primary and elective angioplasty without onsite cardiothoracic surgical backup.

L+M Hospital is a not-for-profit 308-bed acute care community hospital located at 365 Montauk Avenue, New London, Connecticut which is 17.1 miles from Backus. L+M Hospital is an existing provider of primary and elective angioplasty services pursuant to Office of Health Care Access ("OHCA") CON Docket Numbers 04-30297-CON and 12-31768-CON. As an existing provider of primary and elective angioplasty in the service area, L+M Hospital's interests are greatly affected by Backus's proposal to establish another primary and elective angioplasty in the area. All of the data and literature clearly demonstrates a decline in angioplasty utilization, ample available capacity in the service area and other factors that lead to a determination of no clear public need for the Applicant to provide primary or elective angioplasty; all of which will absolutely result in duplicative services. Further, the Applicant has

not satisfactorily identified the population to be served and has failed to define and identify the service area or support the utilization data.

Professional Background

My professional background is described in the Curriculum Vitae attached as Exhibit A. In my role as Vice President and Chief Medical and Clinical Operations Officer, I oversee medical affairs and operations, but have also managed the strategy and planning functions at L+M. Prior to joining L+M, I served as Interim President and Chief Executive Officer for Olean General Hospital in New York. My residency training was in Family Medicine at Eastern Maine Medical Center, and I completed my medical degree at Johns Hopkins University School of Medicine.

I. No Clear Public Need Has Been Established

The Applicant's has failed to establish a clear public need for either primary or elective angioplasty in its proposed service area. The Applicant:

- does not adequately address declining PCI volume;
- relies upon improper data for its volume prediction;
- fails to acknowledge that providers are combating heart disease through other non-invasive methods;
- fails to acknowledge historical discharge data does not support public need;
- mischaracterizes the existing and available PCI services; and
- fails to address its own response times.

A. The Applicant does not Adequately Address Declining PCI Volume

The Applicant improperly calculates utilization growth in providing volume projections in future years despite clear, undeniable research that national and statewide angioplasty volumes

are declining. In its Application, Backus states it expects a substantive 24% growth in angioplasty services.[1] OHCA itself has acknowledged the nationwide decline and elaborated on the decline in Connecticut: "National PCI procedure volume peaked in 2006 and has since dropped 30% because of factors such as increased emphasis on the use of other treatment modalities that include drug eluting stents and medical therapy, improved primary and secondary prevention efforts and reduced incidents of STEMI. Similar to the nation, statewide PCI volumes have been declining over the last seven years. The total number of PCI procedures in Connecticut dropped 20% from 8,966 to 7,154 between FY 2007 and FY 2013."[2] Backus's data filed in its initial CON application also demonstrates about a 10% decrease in Primary PCI services from 2009 to 2014.[3]

L+M Hospital is not alone in questioning Backus's proposed volume growth as OHCA itself questioned this in its completeness questions to Backus on October 30, 2015. Even with further OHCA inquiry, the Applicant still did not properly address the clear downward trend of PCI volume. Rather, Backus admits it does "not incorporate state or national trends" and goes on to state that "data suggests that total PCI volumes in the State of Connecticut are not declining across the board" and "total PCI trends remained fairly flat" and then stated that "PCI volumes in totality only declined 5% over six years."[4] These statements demonstrates Backus's utter failure to address clear and undeniable declining volumes and shows how Backus has erroneously presented arguments in spite of OHCA's records that clearly show volumes are declining

[1] Application at 69.
[2] Connecticut Department of Public Health, *Hospital Transfers of Emergency Coronary Angioplasty Patients for Elective Surgery or Open Heart Surgery: October 1, 2013 to September 30, 2014* at p. 8 (January 15, 2015) (hereinafter referred to as "Hospital Transfers"). http://www.ct.gov/dph/lib/dph/ohca/misc/pa_13-208_sec._69_cardiac_transfers_report_final.pdf
[3] Application at 465.
[4] Application at 1444;1445; and 1446.

statewide. Backus questions the legitimacy of OHCA's analysis. Backus's representations are also inconsistent from the Application to the completeness question responses. Initially, Backus states that angioplasty volumes are expected to increase by 24%, states angioplasty volume is flat and then states volume is declining. These points represent only some of the incorrect assumptions that are serious flaws in Backus's analysis that cannot be reconciled and must lead to a finding that Backus has not established a public need.

B. Backus Relies Upon Improper Data to Assess Public Need

Furthering Backus's failure to establish public need, the Applicant relies on the wrong data and improperly uses cardiac risk factors to develop the Applicant's proposed patient utilization figures instead of relying on historic angioplasty data from Backus's service area. The Applicant dramatically and extensively describes many cardiac risk factors at length for the population in its "Angioplasty Region" rather than address the fact that the historical data for the service area will not yield qualifying utilization results. The 2015 community needs assessments provided by Backus in its initial CON application filing and subsequent completeness questions responses do not suggest the region is sicker, unhealthier, has poorer social determinants of care, or has barriers to access that would warrant the addition of a PCI program at Backus.

As depicted in Attachment B, C, and D, in nearly every category for each market analyzed (Eastern Region, Backus Hospital Service Area, and Windham Hospital Service Area), the communities fare equal or better than both Connecticut and/or United States averages. The Applicant cites to the fact that the "Angioplasty Region" population has a high percentage of residents over the age of 45 (45%) when in fact, that percentage is the same as the State's average.[5] Moreover, according to Backus's sources, the percent of residents aged 65+ is less

[5] Application at 454.

than Connecticut's rate (15% versus 16%). Thus, the age breakdown of the Angioplasty Region does not translate into need for an additional PCI provider as Backus's application would suggest. The Applicant cites "low socioeconomic status" for residents of the Angioplasty Region, and high percentage of households with median income less than $50,000 as reasons for high prevalence for coronary heart disease. According to data from the Connecticut Economic Resource Center (CERC) provided in Attachment E, only two of the 28 towns in the Angioplasty Region or Backus PSA have median household incomes less than $50,000. Furthermore, increased prevalence of coronary heart disease, as noted in a recent publication from the Connecticut Department of Public Health, is tied to annual incomes less than $25,000. Adults with these household incomes "are significantly more likely to have had a stroke or coronary heart disease compared to adults with annual household incomes of $50,000-74,999 and $75,000 or more." Thus there is no correlation that can be made between the household income of the region and increased need for PCI services.

The STEMI data cited in the Application[6] is from six years ago - too old to be relied upon. Further, Backus relies heavily upon heart disease mortality, which is not a predictor of PCI need. Heart disease mortality rates are declining nationally, statewide, and regionally. Data provided in Backus's initial CON application shows mortality rates in eastern Connecticut have fallen significantly recently, outpacing declines in Connecticut and the United States overall as depicted below.

[6] Application at 463.

Heart Disease Mortality Rate Trends				
	2005-2007	2007-2009	2009-2011	2011-2013
Eastern CT	182.5	178.3	174.4	165.7
CT	173.7	168.9	158.7	153.4
US	200.7	185.8	177.6	171.3
Heart Disease Mortality Rate % Change between Time Periods				
	2005-2007	2007-2009	2009-2011	2011-2013
Eastern CT		-2.3%	-2.2%	-5.0%
CT		-2.8%	-6.0%	-3.3%
US		-7.4%	-4.4%	-3.5%

Source: Eastern Region Community Health Assessment, provided by Backus in its initial CON application

Higher mortality does not translate into a need for more PCI services, as heart disease encompasses a multitude of diagnoses (e.g., cardiomyopathy, myocarditis, atrial fibrillation and flutter, endocarditis, etc.), conditions that can and often should be treated with alternative therapies such as medications or surgical interventions.

C. *The Applicant Has Failed to Acknowledge that Providers are Combating Heart Disease through Other Methods*

The Applicant fails to acknowledge that the health care community is combating heart disease through preventative methods including better control of high blood pressure and high cholesterol and smoking cessation, and fails to address the improvements in treatments, medication and quality of care.[7] The use of statin drugs and other non-interventional treatments will contribute to continuing declines of primary and elective angioplasty volumes. Factors contributing to the decline also include a reduction in restenosis by drug-eluting stents, a greater emphasis on medical therapy for the treatment of stable coronary artery disease, enhanced primary and secondary prevention efforts, the increasing use of techniques such as fractional

[7] "Generally, both primary and elective PCI volumes are declining in the nation and in Connecticut because of increased emphasis on other treatment modalities." *Hospital Transfers* at 10.

flow reserve to better evaluate lesion severity and the development and application of appropriate use criteria. These factors are not minor – they represent significant changes in the provision of cardiac care that have directly impacted the amount of angioplasty procedures nationwide and statewide. By failing to addressing the use of increased efforts to combat heart disease through methods other than primary and elective angioplasty, Backus has failed to properly and clearly assess the needs of the proposed service area.

D. Backus has Mischaracterized the Availability of Existing Services

Backus has mischaracterized the readily available and existing angioplasty services. As declared by OHCA itself, "[t]here is no evidence of unmet need for the provision of PCI in the system; however, there is indication of excess capacity."[8] L+M Hospital offers care only 17.1 miles and twenty-one (21) minutes away from Backus. The distance from L+M to Backus is shorter than the previously denied Norwalk Hospital program, which was denied, in part, due to proximity to other providers. Moreover, L+M Hospital has no backlog and can accept additional volume. Currently, 11.3% of the Angioplasty Region patients are served at L+M Hospital resulting in a large impact to L+M Hospital's existing PCI program.[9] Backus admits that "some towns in the OHCA defined region are better served by other institutions, such as Lawrence + Memorial, Hospital of Central Connecticut, or John Dempsy, due to the proximity of the patient's origin to the PCI capable facility."[10] Backus states that in Fiscal Year 2015, L+M treated 32 patients from Backus's proposed Angioplasty Region;[11] 32 cases represents a huge percentage of patients for programs that need 200 cases a year to maintain quality.

[8] *Hospital Transfers* at 8.
[9] Application at 46.
[10] Application at 1461.
[11] Application at 1464.

E. Backus's Own Inadequate Responses Are Problematic and Do Not Support a Finding of Public Need

Backus also argues that patients in the Angioplasty Region are subject to door to balloon times that are too long and over the suggested limits and therefore there is need in the Angioplasty Region.[12] Backus's door-in-door-out time ("DIDO"), defined as the time between arrival at a non-PCI-capable facility to discharge/transfer to a PCI-capable facility,[13] is seventy-three (73) minutes, forty- three (43) minutes over the recommended thirty (30) minute DIDO timeframe.[14] Should Backus meet the thirty (30) minute DIDO time and transfer patients to L+M which is only twenty-one (21) minutes away, Backus patients will be in a much more favorable position than patients who are subject to Backus's current DIDO average of seventy-three (73) minutes. Although Backus claims to have exhausted all means to reduce DIDO further, data Backus provides suggests other non-PCI-capable hospitals have been able to fare better, including Middlesex Hospital, Charlotte Hungerford Hospital, Griffin Hospital, and Day Kimball.[15] A finding of public need for a PCI program at Backus is highly questionable given that Backus has failed to adequately improve DIDO response time, and is thus contributing largely to any delays in time to device for STEMI patients. In addition, Backus's prolonged DIDO times call into question the ability of Backus to operate a safe and effective PCI program.

F. Historical PCI Discharges Do Not Support a Finding of Public Need

Lastly, the historical PCI discharges in the area do not support the Application. CHIME data shows that Hartford Hospital only had a total of 50, 49 and 45 PCI patients from New

[12] Application at 49.
[13] Application at 26.
[14] Application at 475.
[15] Application at 1450.

London, Windham and Tolland counties respectively in 2014. It is highly unlikely Backus will draw all Hartford Hospital's patients from New London, Windham and Tolland counties. Even if Backus were to take all of Hartford Hospital's angioplasty patients from Backus's proposed service area, it will not reach the threshold of 200 cases.[16] The current PCI discharges do not support Backus meeting the required 200 case minimum. Further, Backus will not meet the minimum number required for primary angioplasty.

In sum, Backus has failed to establish public need. The Applicant fails to establish clear public need because the Applicant does not adequately address declining PCI volume; relies upon improper data for its utilization prediction; has failed to acknowledge that providers are combating heart disease through other non-invasive methods; has mischaracterized the existing and available PCI services; has failed to address its own inadequate response times; and the historical discharge data does not support public need.

II. No Satisfactory Identification of the Patient Population to be Served

The Applicant has not satisfactorily identified the population to be served. The Applicant has not properly identified the population to be served because the Applicant utilized a fabricated service area; Backus fails to provide proper evidence to support the use of towns outside its traditional OHCA-defined service area; Backus has failed to address how it will change referral patterns; and Backus improperly assumes that volume from other service areas will transfer to Backus.

[16] See, "Hartford Hospital Inpatient PCI Volume Analysis by County, FY 2014" CHIME data.

A. The Applicant Has Fabricated the Service Area

The Applicant is using its own fabricated term ("Angioplasty Region") that does not align with the Hospital's historical service area or a recognized OHCA service area.[17] In fact, the Angioplasty Region contains seventeen (17) towns that are not included in the recognized Backus service area. Backus excludes Ledyard and Montville from their analysis of volume, citing these towns are closer to L+M.[18] As noted in Attachment F and Attachment G, this is not true. Travel time from these towns to Backus is shorter than to L+M. Therefore, it is not beyond reason to include L+M volumes from these towns as "at-risk" with the program at Backus, given the proximity of the towns to Backus vs. L+M. Proper hospital strategic planning is dependent on historical patient populations, CHIME data and other resources collected and analyzed by OHCA and other public and private agencies.

Backus has not followed these accepted methods and is instead anticipating drawing patients outside of its service area – presumably to ensure that it meets the required patient utilization figures required in the medical literature on the development of angioplasty programs. Some of these towns may send patients to closer, out of state providers. Backus fails to include out of state PCI providers and acknowledges the same in the first few pages of its Application. Backus is not the closest provider to four (4) towns in the Angioplasty Region. Pomfret, Putnam, Thompson, and Woodstock are all closer to UMass Memorial Medical Center ("UMass") located in Worcester, Massachusetts. UMass is full-service cardiovascular provider with primary and elective angioplasty, as well as a cardiac surgery program. As noted in the Day

[17] Application at 37.
[18] Application at 1454.

Kimball Healthcare ("DKH") Community Health Needs Assessment Implementation Strategy from September 9, 2013, DKH "strengthened [its] relationship with UMass for STEMI transfers" and "met regularly with [their] UMass partners to review STEMI data." Clearly, a strong referral relationship exists between DKH and UMass for STEMI patients, and patients' needs in these four (4) towns are already being met. Nine (9) towns in the "Angioplasty Region" are already within 30 minutes' travel time of an existing primary PCI provider (towns include Bozrah, Colchester, Columbia, Franklin, Hebron, Lisbon, Norwich, Preston, and Sprague). Patients' needs in these 9 towns are already being met. Two (2) towns not included in the "Angioplasty Region," but part of Backus's primary service area per established discharge data, OHCA and CMS are already within 30 minutes of an existing primary PCI provider (towns include Ledyard and Montville). Patients' needs in these 2 towns are already being met. The other 13 towns in the "Angioplasty Region" are within 31-45 minute drive time of an existing PCI provider (towns include Brooklyn, Canterbury, Chaplin, East Haddam, Griswold, Hampton, Killingly, Lebanon, Mansfield, Plainfield, Sterling, Voluntown, and Windham). Patients' needs in these 13 towns are already being met. By creating a broad service area, Backus has utilized false and insufficient evidence to support the projected patient population to be served.

B. Backus Fails to Provide Proper Evidence to Support the Use Towns Outside Recognized State and National Criteria for a Defined Service Area

Backus's relies upon on a consultant, 3d Health, Inc. ("3d"), to derive a contrived service area rather than rely on its own historical patient draw or state or national criteria for a defined service area. 3d also fails to provide adequate supporting documentation – for example, there is no backup for the source of Outpatient Elective PCI Cases or Unmet Need/Other Outmigration in the 3d report. Further, Backus contends that low PCI procedure rates in the Angioplasty Region

are the result of under-utilization of PCI services. Research evaluating geographic variation in PCI use rates have suggested that lower rates are not due to under-utilization, rather "geographic regions with lower PCI rates have a higher proportion of PCIs performed for appropriate indications." Thus, the lower utilization rate can be attributed to appropriate use.

C. Backus Has Failed to Address How It Will Change Referral Patterns

Backus is also anticipating drawing PCI volume from the pool of patients who are sent to Hartford Hospital and L+M Hospital. Backus has not satisfactorily identified that these patients will be now served at Backus because Backus has not offered any evidence that it will be able to change traditional and consistent referral patterns of sending patients to L+M, an existing provider of primary and elective angioplasty in the service area or to Hartford Hospital, a high-volume angioplasty program with surgical backup.

There is a large cardiology group that serves the Angioplasty Region that is affiliated with Yale (Cardiology Associates, Norwich, CT) and Backus has offered no evidence that such group would change its referral patterns of sending its patients to established affiliated programs at Yale or L+M. Backus anticipates 48 cases would shift to Backus from Yale;[19] based on current referral patterns, the shift of almost 50 cases a year is unreasonable. The Application does not address any other referral relationships by physicians in the area that would refer patients to Backus over other hospitals currently serving the market. It is not appropriate to assume that a patient who meets the certain angioplasty criteria in the Angioplasty Region will receive angioplasty at all or will receive such services at Backus. Patients may receive other

[19] Application at 1446.

treatment or obtain primary angioplasty at other facilities due to ambulance patterns or proximity to other locations.

D. Backus Improperly Assumes that Volume from Other Service Areas Will Transfer to Backus

Backus has improperly relied upon the combined ED market share for Backus and Windham Hospital; relying on Windham Hospital data is far-reaching. Additionally, based on L+M's experience, it is unreasonable to assume that Backus will retain all the volume based on STEMI incidence alone. L+M only realizes a 54% retention rate for patients with STEMI in the market – Backus's projections of 80% are unreasonable. Further, patients may seek elective angioplasty at other locations due to proximity, familiarity, backup surgery option, provider recommendation, referral patterns, etc. The Applicant even notes that 58% of its "Angioplasty Region" patients travel to Hartford Hospital or Yale to receive elective angioplasty.[20] Thus the anticipated "Angioplasty Region" does not account for patients who may want to have elective angioplasty at a different hospital (for example, Yale because it has open heart surgery backup or L+M Hospital because it is closer).

Backus's elective PCI projections are overstated. On page 1459 of the Application, Backus provides data which shows of 234 diagnostic catheterizations completed at Backus, 21.36% or 50 cases were transferred for elective PCI. This is consistent with L+M's existence experience as demonstrated below in Column E:

[20] Application at 45.

	Column A	Column B	Column C	Column D	Column E	Column F
	Total Diagnostic Caths at L+M	Total Patients Requiring Elective PCI	Total Patients with Elective PCI at L+M	Total Patients Transferred for Elective PCI	% of Diagnostic Caths with Elective PCI	% of Diagnostic Caths with Elective PCI at L+M
FY 12	583	108	0	108	18.5%	0.0%
FY 13 below elective PCI approval on 2/4/13	197	35	0	35	17.8%	0.0%
FY 13 after elective PCI approval on 2/4/13	354	84	55	29	23.7%	15.5%
FY 14	677	145	99	46	21.4%	14.6%
FY 15	632	128	95	33	20.3%	15.0%

As stated above, clinical guidelines specify that for certain high-risk patients, elective PCI at facilities without onsite surgical backup is contraindicated due to the increased potential for a serious complication during the procedure. For this reason, as demonstrated in Column F, only a subset of candidates for elective PCI can have their procedure at L+M. The rest are transferred or referred to another facility with onsite surgery capabilities.

Since Backus's proposed angioplasty services are markedly similar to L+M's established program, it would seem reasonable to assume Backus will have a similar experience to L+M. As applied, based on Backus's diagnostic catheterization volume[21] Backus's elective PCI volume would only be 35 cases (234 cases x 15%). This figure is significantly lower than Backus's stated projection of 151 cases.[22]

Additionally, a rule-of-thumb is every three (3) diagnostic catheterization procedures result in one (1) elective PCI case. Further, although literature states that approximately 89% of

[21] Application at 1459.
[22] Application at 70.

elective PCI cases are appropriate for sites without onsite surgery,[23] using this methodology, Backus's elective PCI volume would equate to 69 cases. However, L+M's capture rate is 74%. This 74% capture rate would more accurately reflect what Backus should expect. Using the 74% capture rate, Backus's elective volume would only equate to 58 cases. Thus under these two alternate methodologies, Backus's elective PCI volume is still significantly less than the hospital has projected in its CON application.

Even without calling into question Backus's projected primary cases (which is addressed elsewhere in this pre-file testimony and by my colleagues), Backus would only complete 148 PCI procedures in the first year of operation using the best case methodology above for elective volume (or 69 cases). Thus, Backus's volume would be far below the 200 case minimum recommended in the clinical guidelines.

Although clinical guidelines state that angioplasty services offered at hospitals that perform under 200 cases may be acceptable, such approval is only if the hospital is located in a region underserved because of geography. The 2014 guidelines have clearly defined geographic isolation "not by distance but by the time required for emergent transport of a STEMI patient to another facility."[24] The guideline states geographic isolation is demonstrated if the travel time between facilities is >30 minutes. As mentioned several times in this pre-filed testimony and by my colleagues, the travel time between Backus and L+M is 21 minutes. This time is far below the 30-minute threshold. Therefore, Backus has not met the criteria for geographic isolation, and it is inappropriate for Backus to operate angioplasty services that would not have a minimum of

[23] Aversano, T., et al. Outcomes of PCI at Hospitals with or without On-Site Cardiac Surgery. N Engl J Med 2012; 366: 1792-1802.
[24] *ACCF/AHA/SCAI Guidelines*, 2014 update, Catheterization and Cardiovascular Interventions 84:169, 180 (2014).

200 cases per year. As indicated above, even without accounting for statewide and national PCI volume decline and other factors, Backus will not hit the 200 case threshold.

Without an appropriate analysis of patient retention, the proposed patient population to be served is not identified. Additionally, Backus cannot expect to re-direct all "Angioplasty Region" volume from Hartford Hospital. Elective PCI programs without onsite cardiothoracic surgical backup are prohibited from performing cases on high risk patients with or without high risk lesions. Thus, it is entirely inappropriate to assume all Hartford cases would shift to Backus as this would be in direct contradiction to all recent clinical guidelines remarking on appropriate use of elective PCI.

In sum, Backus fails to support the finding of the population to be served. The Applicant has not properly identified the population to be served because the Applicant utilized a fabricated service area; Backus fails to provide proper evidence to support the use towns outside its traditional OHCA-defined service area; Backus has failed to address how it will change referral patterns; and Backus improperly assumes that volume from other service areas will transfer to Backus.

III. The Project is not Consistent with Standards and Guidelines

One of the most critical factors in reviewing CON applications is how the proposal meets standards and guidelines established and/or adopted by OHCA. Any such standards and guidelines are utilized to ensure all potential patients in the state receive safe and efficient care. Applicant's arguments are inconsistent with benchmarks and standards adopted by OHCA

through its adoption of the peer-reviewed ACCF/AHA/SCAI Guidelines,[25] as amended.[26] Backus's proposal is inconsistent with the standards and guidelines because the proposal is not consistent with guidelines that discourage the establishment of duplicative services within a 30-minute transfer time; OHCA's guidelines do not support the development of directly competitive programs; and Backus improperly relies on obsolete guidance.

A. The Proposal is Not Consistent with Guidelines Which Discourage the Establishment of Duplicative Services within a 30 Minute Transfer Time

First, the proposal is not consistent with a major factor in the ACCF/AHA/SCAI Guidelines which states that "the development of PCI facilities within a 30-minute transfer time to an established facility is therefore strongly discouraged."[27] L+M's established primary and elective angioplasty program is a mere twenty-one (21) minutes away from Backus Hospital and is clearly within the recommended thirty (30) minute transfer time. The Applicant wholly ignores this factor and offers immaterial evidence about patient origin distance from L+M Hospital to distract from the fact that L+M Hospital is a qualifying transfer location for Backus. Patients are better served at existing facilities as there is no benefit to competing programs within the same geographical region. L+M Hospital's existing primary and elective angioplasty program meets the needs of all patients of Backus Hospital as it is within the recommended transfer time. The ACCF/AHA/SCAI Guidelines state that "[i]f the transfer time is ≤ 30 min, it

---

[25] *"ACCF/AHA/SCAI Guideline for Percutaneous Coronary Intervention; a Report of the American College of Cardiology Foundation/American Heart Association Task Force on Practice Guidelines and the Society for Cardiovascular Angiograph and Interventions,"* as updated and amended (the "ACCF/AHA/SCAI Guidelines").

[26] OHCA has endorsed the ACCF/AHA/SCAI Guidelines. Connecticut Department of Public Health Office of Health Care Access, *Statewide Health Care Facilities and Services Plan,* at p. 41 (October 2012; supplemented 2014) (hereinafter referred to as "Statewide Health Plan") http://www.ct.gov/dph/lib/dph/state_health_planning/dphplans/ohca_statewide_facilities_services_plan_2012.pdf; http://www.ct.gov/dph/lib/dph/ohca/publications/2014/final_2014__facilities_plan_-_2_24_15.pdf; *Hospital Transfers.*

[27] *ACCF/AHA/SCAI Guidelines*, 2014 update, Catheterization and Cardiovascular Interventions 84:169, 180 (2014).

is reasonable to assume that transfer to the nearest PCI center will provide reperfusion as rapidly as if it were available at the first hospital."[28] The addition of a program well within a thirty (30) minute transfer time from Backus Hospital would be redundant and would be directly against the directives of the established ACCF/AHA/SCAI Guidelines adopted by OHCA and by the cardiology community as a whole. More PCI sites have been shown to not improve access sufficiently to justify the expense, and the impact on alternative providers whose volume inevitably is negatively impacted by new sites siphoning volume in a declining PCI market.

B. OHCA's Guidelines Do Not Support the Development of Directly Competitive Programs

Second, Backus's proposed primary and elective angioplasty program will be in direct competition with "another PCI program in the same geographic area" (L+M Hospital), which is against OHCA's guidelines on the development of new angioplasty programs and, as OHCA continues to command, would "not be in the best interest of the community."[29] As such, competition with L+M Hospital is not in the best interest of the community. In direct contrast to OHCA's directive, Backus incorrectly states that the impact it will have is not significant and it will not adversely affect existing programs, even though L+M Hospital is in Backus's geographic area and serves a large portion of angioplasty patients from Backus's service area. In FY 2015, 32 PCI cases at L+M originated from patients who resided within Backus's "Angioplasty Region."[30] This represents a significant portion of L+M's total PCI volume for FY 2015. Backus also represents that 51 PCI cases at L+M originated from patients who resided within Backus's OHCA-defined service area.[31] Given the patient origin for L+M's existing volume, L+M is at-risk for a substantial volume reduction should Backus be granted approval to

[28] *ACCF/AHA/SCAI Guidelines*, 2014 update at 180.
[29] *Statewide Health Plan* at p. 39.
[30] Application at 1464.
[31] Application at 1458.

start a PCI program. This decline will reduce L+M volume to well below 200 cases, the minimum threshold recommended in the latest expert clinical guidelines.

In sum, Backus's proposal is inconsistent with standards and guidelines because the proposal is not consistent with guidelines that discourage the establishment of duplicative services within a 30-minute transfer time and OHCA's guidelines do not support the development of directly competitive programs.

IV. The Proposal is Unnecessary and Duplicative

Existing health care facilities including L+M Hospital are satisfactorily meeting the needs of the Backus service area and any additional angioplasty programs are unnecessary and duplicative. Backus's proposed patient population draws patients that are being serviced by existing, OHCA-approved PCI providers (e.g. Hartford Hospital, Yale, L+M Hospital). L+M has two catheterization labs, no backlog, and the capacity to accommodate and accept additional PCI volume. Backus has not fully acknowledged the presence of non-Connecticut providers, even when they are closest PCI-capable facility to Angioplasty Region residents. Duplicative services within the thirty (30) minute transfer, such as patients transferred from Backus to L+M Hospital, are unnecessary. Cardiac physicians in Connecticut perform angioplasties at various locations – to add an additional location for these providers without a clear benefit to the public is unnecessary and results in providers referring patients to certain hospitals to keep institutional volumes at certain levels. Specifically, "[c]ardiac experts guidelines recommend that to maintain competency, physicians must perform PCI procedures at high volume institutions; this has an impact on PCI referral patterns"[32] Approving this proposal will add an identical service to the

[32] *Hospital Transfers* at 9.

same geographic region in the state. Backus has not listed any incidents of patient harm based on having to transfer patients to other hospitals.

V. Conclusion

In conclusion, Backus's application for primary and elective angioplasty should be denied because Backus has failed to establish a public need; the Applicant has not has satisfactorily identified the population to be served by failing to accurately identify the service area and failing to estimate utilization data in a reasonable manner; the proposal is not consistent with standards and guidelines; and the proposal is unnecessary and duplicative. We ask that this application should be held to the high standards and scrutinized under the same light as other angioplasty CONs in recent years. In today's fragile hospital marketplace, hospitals must strategically plan to continue to first offer the basic and safety net services for communities and ensure the existence of the same.

Thank you for providing the opportunity to speak today. I am happy to answer any questions.

IN RE: ESTABLISH AND OPERATE	:	
A PRIMARY AND ELECTIVE	:	
ANGIOPLASTY PROGRAM AT THE	:	
WILLIAM W. BACKUS HOSPITAL	:	**MARCH 18, 2016**

PRE-FILE TESTIMONY OF SETH VAN ESSENDELFT

Good Morning. My name is Seth Van Essendelft and I am the Chief Financial Officer and Vice President of Support Services at Lawrence + Memorial Hospital, Inc. ("L+M Hospital" or "L+M"). I am here today to speak in opposition of the William W. Backus Hospital (the "Applicant" or "Backus") Certificate of Need ("CON") application (the "Application") to provide primary and elective angioplasty without onsite cardiothoracic surgical backup.

My testimony will address: (i) the adverse financial impact that the Applicant's proposed services will have on L+M, a newly-established program; (ii) the negative impact to the financial strength of the health care system in the state, (iii) that evidence suggests the services are not financially feasible for the Applicant, and (iv) that the proposed services will adversely affect health care costs and accessibility.

Professional Background

My professional background is described in the Curriculum Vitae attached as Exhibit A to my testimony. I am currently Chief Financial Officer and Vice President of Support Services of L+M Health Care where I oversee the financial and support operations at two acute care hospitals (L+M and Westerly Hospitals), and the Lawrence + Memorial Medical Group. Prior to joining L+M, I served in other similar financial and operational roles of progressing

responsibilities at two other health systems outside CT, and one of the national health insurance companies.

I. Negative Impact to L+M's Established Program

The Applicant's proposed services will have a negative impact on L+M's newly established program. In 2013, L+M received CON approval to establish elective angioplasty as an adjunct to its existing primary program. There were several important clinical and community reasons to add this service, and the reality to improve the financial performance of L+M's angioplasty program, and reduce the operating loss of the primary underlying program. L+M has dedicated precious financial resources and personnel to its angioplasty program. L+M's expenditure to staff the program 24/7/365 with highly trained interventional cardiologists is very costly, especially for community hospitals such as L+M where the market volume is not large compared to much larger metropolitan areas. L+M's yearly costs just to maintain 24/7/365 access is in excess of $1.5 million. In addition, L+M continues to invest in technologies and equipment to support the program, including two state-of-the-art cardiac catheterization labs at L+M hospital. The majority of these operational costs and all of the capital costs are fixed, and as such do not fluctuate with volume. With dwindling volumes statewide and nationally, the cost per case to provide PCI services is beyond the revenues generated. However, L+M provides such service at a loss, to meet community needs and improve access for this region. By adding elective PCI, and not substantially altering the fee to staff the program, L+M improved the financial position of its much needed PCI program.

Additionally, L+M has continued trying to grow its program by providing outreach to neighboring hospitals, including Backus Hospital, and Westerly Hospital in Rhode Island. In the Backus Application it was noted that Backus anticipates drawing patients from the L+M service

area. This will decrease L+M's volume and associated revenues which will have a negative impact on both the proficiency and financial viability. If approved, the Applicant's proposal will reduce both primary and elective PCI volume at L+M, thus leading to larger financial losses as L+M's fee to have 24/7/365 physician coverage of its program is consistent, regardless of volume. In FY 2015 alone, Backus states that 32 PCI cases at L+M originated from patients who reside within Backus's "Angioplasty Region."[1] This represents a significant portion of L+M's total PCI volume for FY 2015. Backus also represents that 51 PCI cases at L+M originated from patients who resided within Backus's OHCA-defined service area.[2] This represents a 23.6% portion of L+M's total PCI volume.[3] Any way it is looked at, a large percentage of L+M's patients derive from Backus's service area. Were Backus to siphon these cases from L+M, L+M will experience a significant incremental financial loss. The applicants, in their proposal, contend that L+M will see no volume reductions with the establishment of their PCI program. Given the patient origin for L+M's existing volume, this assumption seems highly unlikely and is not supported by existing data, with outcomes contrary to the assertion that will very likely place L+M's program at financial risk.

II. Negative Impact to the Financial Strength of the Health Care System

There will be a negative impact to the financial strength of Connecticut's health care system by the addition of duplicative and costly angioplasty services at Backus Hospital. This negative impact is shown by Backus's proposal being an improper use of its funds and the establishment of an unnecessary program, and the financial adverse impact to established programs at L+M and other hospitals.

---

[1] Application at 1464.
[2] Application at 1458.
[3] *Id.*

It is no secret that Connecticut hospitals are facing serious financial challenges in the current healthcare market. The gap between costs and reimbursement and other financial concerns has placed a significant financial burden on Connecticut hospitals. These financial challenges are leading to further consolidation of the market to best utilize resources and capacity. More so now than ever, hospitals must carefully plan strategic investments or risk disrupting the fragile financial status of the hospital and the Connecticut health care environment. Without careful planning, the State's health care system is threatened.

The research and due diligence we have evaluated suggests that Backus has not adequately considered its provision of primary and/or elective angioplasty in light of these fundamental financial and quality concerns. Simply put, Backus is proposing to invest nearly $5 million dollars of scarce capital resources into a program that is duplicative of existing providers in the service area and that will continuously operate at a larger deficit each year with no prospective break-even point. Backus highlights the minimal savings from transportation costs but these proposed savings are overshadowed by the considerable annual loss accounted for in the operation of the proposed program. Backus also fails to address how it will adapt and support a full primary and elective angioplasty program in light of recent negative financial impacts, especially the increased hospital taxes and inadequate Medicaid reimbursement. By operating a duplicative program, which will operate at a loss, and attempting to extract patients away from existing providers at established angioplasty services in the service area, Backus negatively impacts the financial strength of the broader health care system.

Additionally, drawing patients from other hospitals that adequately meet the primary and elective angioplasty needs of the service area will result in negative impacts to those hospitals with existing programs, especially programs that are continuing to build volume in order to be

fully established. Primary and elective angioplasty are particularly expensive and laborious programs to operate due, in part, to the requirement to have trained cardiologists on call twenty-four (24) hours a day. Backus claims that the program will offer a critical service to its "Angioplasty Region" patients however Backus does not address how the program will negatively affect the state's current programs. As it is unlikely that Backus will reach its projected utilization figures based on other testimony offered, Backus is doing a disservice to the residents of this state by directing scarce resources to a program that, because it will not meet the minimum utilization required of facilities and will offer more harm than benefit, ultimately compromising patient care. Addition of a program to the service area will contribute to a decrease in the overall financial stability of the state's health care delivery system.

III. Project is Not Financially Feasible

By the Applicant's own admission, this proposal is not a profitable endeavor and specifically shows a decreasing deficit continuing from year to year. Backus will experience a significant financial loss in order to offer angioplasty services. The project will require an almost $5 million-dollar investment to upgrade the Backus facilities to be able to accept primary and elective angioplasty cases.[4] Based on the unprofitability of the proposal and the availability of duplicative angioplasty programs in the area, it is questionable why Backus is seeking approval of this project. Furthering the fact that the financial projections are not feasible, the Applicant's financial projections are based on inflated volumes that did not take into account declining angioplasty volumes and demand levels across the nation and the state.[5]

[4] *Application* at 67.
[5] *Hospital Transfers* at 8.

00069

IV. Project Will Adversely Impact Health Care Costs and Accessibility

The Applicant has outwardly stated this is not a profitable endeavor and that a large capital investment will be required to operate the program. The return on this capital investment may never be realized at Backus Hospital, which may require a different financial perspective and passing of costs onto patients and all healthcare stakeholders as resources become increasingly restrictive. It most certainly does not consider the implications to L+M as outlined earlier. Additionally, while our comments have focused on the operating costs of the hospital, we should be clear that there will be increasing costs and challenges in recruiting and retaining specialized staff and physicians to support duplicative programs without either resulting in sufficient volume to ensure sustainability. The introduction of an additional, unnecessary primary and/or elective angioplasty program into the service area will result in undermining the quality of PCI services at all hospitals in the service area. "Cardiac experts guidelines recommend that to maintain competency, physicians must perform PCI procedures at high volume institutions; this has an impact on PCI referral patterns"[6]. This type of result could prevent Backus from every truly developing a high quality program, while at the same time, place real risk on diluting the proficiency of the L+M program, which in both cases adversely drives up health care costs for payors and patients.

In addition, the 2014 SCAI/ACC/AHA Guidelines for PCI without onsite surgery state, "for the future, the focus must now shift to developing a rational plan for the distribution of PCI services. Small PCI programs with large fixed costs are inefficient and unnecessary if they do not improve access in areas of need." The guideline goes onto to state, "the writing group reaffirms the statement from the 2011 ACCF/AHA/SCAI PCI Guidelines that "desires for

[6] *Hospital Transfers* at 9.

personal or institutional financial gain, prestige, market share, or other similar motives are not appropriate consideration for initiation of PCI programs without on-site cardiac surgery" and suggests new programs offering PCI without on-site surgery are inappropriate unless they clearly serve geographically isolated populations." For the first time, the 2014 guideline clearly defines geographic isolation as "not by distance but by the time required for emergency transport of a STEMI patient to another facility" and states "multiple low-volume and partial-service PCI centers within a geographic area diffuse PCI expertise, increase costs for the overall health system and have not been shown to improve access. If the transfer time is $\leq$30 min, it is reasonable to assume that transfer to the nearest PCI center will provide reperfusion as rapidly as if it were available at the first hospital." Therefore, the guideline states "the development of PCI facilities within a 30-minute emergency transfer time to an established facility is therefore strongly discouraged." As has been stated, Backus is twenty-one (21) minutes away from L+M, thus the latest clinical guidelines strongly deter programs like Backus is suggesting from forming. Not only are there quality implications of multiple low volume centers, but the guideline cautions that "further declines in PCI volumes might necessitate the closure of PCI programs in the future." Although L+M has provided much needed PCI services to the region to meet the community need at a financial loss the institution for years, even greater financial losses due to less volume will be a great burden to L+M and may impact L+M's ability to invest in its PCI or other program development.

V. Conclusion

In conclusion, Backus's application for primary and elective angioplasty should be denied because the proposal (i) will have an adverse financial impact on L+M, a newly-established program; (ii) will negatively impact the financial strength of the health care system in

Connecticut, (iii) is not financially feasible for the Applicant, and (iv) will increase health care costs, threaten quality and accessibility. In today's fragile hospital marketplace, it is important now more than ever to allocate financial resources prudently in order to continue to provide the basic healthcare safety net services for communities.

Thank you for providing the opportunity to speak today. I am happy to answer any questions. My colleagues will discuss the administrative and clinical deficiencies of the Application.

OFFICE OF HEALTH CARE ACCESS	:	**DOCKET NO. 15-32031-CON**
	:	
	:	
IN RE: THE WILLIAM W. BACKUS HOSPITAL AND HARTFORD HOSPITAL'S CERTIFICATE OF NEED APPLICATION TO ESTABLISH A PRIMARY AND ELECTIVE PERCUTANEOUS CORONARY INTERVENTION PROGRAM AT BACKUS HOSPITAL	:	**MARCH 22, 2016**

THE WILLIAM W. BACKUS HOSPITAL AND HARTFORD HOSPITAL'S MOTION IN LIMINE TO PRECLUDE USE OF DATA REGARDING OUT-OF-STATE PROVIDERS

Hartford Hospital and The William W. Backus Hospital ("Applicants"), by and through their undersigned counsel, hereby request that the Connecticut Department of Public Health ("DPH") Office of Health Care Access ("OHCA") issue a ruling precluding the consideration of out-of-state health care facilities to address the lack of Percutaneous Coronary Intervention ("PCI") providers in the Angioplasty Region in making a determination on the Applicants' Certificate of Need Application to Establish and Operate a PCI Program at The William W. Backus Hospital ("Backus") (the "CON Application").[1]

In its Pre-File Testimony, Intervenor Lawrence + Memorial Hospital, Inc. ("L+M") suggests that out-of-state PCI providers are an appropriate means to address the lack of access to PCI services for patients in the Angioplasty Region. *See Pre-Filed Testimony of L+M*, Pages

[1] Capitalized words not defined herein shall have the meaning set forth in Applicants' CON Application.

00005, 00009, 00010, 00019, 00046. This is wholly inappropriate and OHCA should act to exclude such testimony. Pursuant to OHCA's February 4, 2010 Declaratory Ruling (Docket No. 09-31433-DCR), OHCA is allowed to exclude volume data from out-of-state patients that are treated at a Connecticut health care facility in its evaluation of Certificate of Need ("CON") applications. It necessarily follows that OHCA should also exclude from consideration the use of out-of-state PCI facilities as a solution to the lack of PCI providers in the Angioplasty Region. For the reasons set forth below, OHCA should issue a ruling precluding the consideration of out-of-state PCI facilities to address the lack of PCI providers in the Angioplasty Region.

1. It is inappropriate to consider the availability of out-of-state PCI facilities in evaluating the need for PCI service in the Angioplasty Region because such facilities are not subject to OHCA approval, oversight, reporting obligations, or general OHCA quality control. OHCA does not have a say in the need for such facilities, nor does it have control over the quality of services being rendered by such facilities. Further, out-of-state PCI facilities are not subject to OHCA's rigorous oversight and reporting obligations. Moreover, OHCA has no control over whether said out-of-state PCI facilities will continue to operate and serve nearby patients, including Connecticut patients.

2. It is inappropriate to consider the availability of out-of-state PCI facilities in evaluating the need for PCI service in the Angioplasty Region as continuity of care suffers as a result of in-state patients being treating at out-of-state PCI facilities. Communication among specialists and between specialists and a patient's primary care physician is a key component to continuity of care. STEMI patients treated at out-of-state health care facilities that have Connecticut-based primary care physicians do not have the benefit of community-based relationships between the STEMI physician and the primary care physician that can foster easy

and free-flowing communication. Degradation of the level of communication between a treating and primary care physician can be extremely detrimental to a patient's continuity of care.

3. It is inappropriate to consider the availability of out-of-state PCI facilities in evaluating the need for PCI service in the Angioplasty Region due to challenges that arise in patients' ability to pay for health care costs via insurance. Due to the promulgation of the Patient Protection and Affordable Care Act ("ACA"), health insurance availability and coverage can vary greatly from patient to patient and from state to state. Connecticut patients being treated at out-of-state health care facilities could face long delays in reimbursement of health care costs, or, in some instances, may not be able to use health insurance at all.

4. It is inappropriate to consider the availability of out-of-state PCI facilities in evaluating the need for PCI service in the Angioplasty Region due to challenges that arise in the sharing of Electronic Medical Records ("EMR"). EMRs are an important tool in today's health care industry. EMRs are instrumental in patient continuity of care and in improving efficiency within the industry. The state of EMRs, however, is far from perfect and is certainly not uniform across the industry. Indeed, many health care providers utilize proprietary software unavailable to other health care providers. As a result, sharing of EMRs from practice to practice can be a challenging and time consuming practice. This is especially true when in-state patients are being treated at out-of-state facilities. A delay in transmitting EMRs to a primary care physician can be extremely detrimental to continuity of care.

For the foregoing reasons, the Applicants believe it is inappropriate to consider out-of-state health care facilities in evaluating the need for PCI service in the Angioplasty Region and Applicants hereby request that OHCA issue a ruling excluding the use of such testimony.

Respectfully submitted,

Hartford Hospital and

LAWRENCE + MEMORIAL HOSPITAL, INC.'S OPPOSITION TO THE APPLICANT'S MOTION IN LIMINE TO PRECLUDE USE OF THE DATA REGARDING OUT OF STATE PROVIDERS

Intervenor Lawrence + Memorial Hospital, Inc., ("L+M"), by and through its undersigned counsel, hereby opposes the motion in limine to preclude use of data regarding out-of-state providers submitted by The William W. Backus and Hartford Hospital's (collectively, the "Applicants") on March 22, 2016 ("Applicant's Motion"). The Applicant's have wrongly and inappropriately interpreted OHCA's position on the consideration of out of state providers in Certificate of Need ("CON") analysis. The Intervenor hereby requests that the Department of Public Health ("DPH") Office of Health Care Access ("OHCA") deny the Applicant's Motion and issue a decision that OHCA is permitted to use such data.

I. Applicant Wrongly And Inappropriately Interprets OHCA's Position On The Consideration Of Out Of State Providers In CON Analysis.

The Applicant wrongly and inappropriately interprets OHCA's position on the consideration of out of state providers in CON analysis. The declaratory ruling cited by the Applicant, Declaratory Ruling Docket Number 09-31433-DCR dated February 4, 2010 ("Declaratory Ruling") is strictly limited to the issue of the utilization of out-of-

state **patients** (emphasis added), not out-of-state providers. As stated by OHCA, the issue presented was limited to "whether sections 19a-634 and 19a-637 of the Connecticut General Statutes require or allow the Agency to exclude patients who live out of state, but are treated in a Connecticut health care facility, when evaluating the need for a particular health care service." Declaratory Ruling at 1. After careful analysis, OHCA concludes that "19a-634 and 19a-637 do not require OHCA to exclude patients who live out of state, but are treated at a Connecticut health care facility, from its evaluation of need for a particular health care service." Declaratory Ruling at 8.

At no point does OHCA consider or analyze the use of out of state providers in its Declaratory Ruling. The Declaratory Ruling does not require that OHCA must exclude out of state providers in all CON analysis, only the narrow issue of whether OHCA may use its discretion to exclude out of state providers based on a "review of all evidence submitted." Declaratory Ruling at 8. OHCA further states it will evaluate "each CON application based upon the evidence in each case." *Id.* The Declaratory Ruling is narrow in its scope of addressing only the use of out of state patients and it is inappropriate for the Applicant to draw conclusions on OHCA's behalf that its narrow Declaratory Ruling would lead to unrelated conclusion regarding out of state providers.

II. OHCA Has Discretion To Consider Out Of State Providers In CON Analysis

As there is no statute, regulation or ruling that disallows the use of out of state providers in CON analysis, OHCA may utilize its broad powers to determine public need, including the use of out of state providers in its analysis of CON applications. In fact, OHCA has considered out of state providers in previous CON decisions, including those related to angioplasty services. *See* CON Decision Docket No. 12-31748 Greenwich

Hospital and Yale-New Haven Hospital Establish and Operate an Elective Angioplasty Program Without Onsite Surgical Backup at Greenwich Hospital. ("Each of the existing providers of elective angioplasty is approximately 6 and 11 miles away from Greenwich Hospital. A letter from White Plains Hospital in Westchester County, NY, state that its elective angioplasty program presently has capacity to serve the needs of community and they are not aware of any backlog of cases in their service area." Docket No. 12-31748 at 13.)

Therefore, the Applicant's motion that OHCA exclude out of state provider data is contrary to OHCA's decision in previous angioplasty CON analysis.

III. OHCA Should Consider Out of State Providers in its Consideration of the Application at Issue

OHCA should consider the presence of out of state providers in determining the need for Primary or Elective PCI services in the Application at issue. As was determined in the aforementioned Greenwich CON, OHCA did consider the utilization of out of state providers by Connecticut residents. Therefore, OHCA should consider the presence of out of state providers, such as UMASS, in its analysis of public need in this Application. In fact, OHCA has already requested and considered out of state providers in this Application as evidenced by the questions presented to the Applicant requesting they address volume at UMASS. *See*, OHCA's Issues List to the Applicant, February 9, 2016, Issue #5. Additionally, the Applicant itself has also integrated data relating to UMASS at pages 1458 and 1464 of the Application.

OHCA should consider out of state providers in assessing need for health care services and whether Connecticut residents have access to needed services irrespective of

whether those services are provided by in or out of state provider. Out of state providers should not be excluded from OHCA's CON analysis. OHCA is rightly considering these out of state providers because concerns related to quality and overutilization transcend state bounds. The numerous quality concerns outlined in the SCAI/ACC/AHA Expert Consensus Document relating to decreased quality when there are multiple low-volume providers within close proximity are present whether or not the providers are located in contiguous states. OHCA should recognize that Connecticut residents are affected by decreased quality whether or not such low-volume providers are duplicative to in-state or out-of-state providers.

Lastly, the Applicant's arguments relating to insurance, community relationships and electronic medical records ("EMR") are misplaced. The issues of out of state health insurance coverage are not unique to patients in Connecticut or any resident living near a state border. However, coverage for an emergent service, such as primary angioplasty, is likely not an issue for patients with insurance coverage. Further, Medicare coverage is national. As for the Applicant's argument relating to communication between community based physicians and institutions, it is inaccurate to say that many community and institutional relationships do not transcend state bounds. The Intervenor's own health system operates hospitals in Connecticut and Rhode Island. Finally, EMR issues relating to compatibility are also not unique to Connecticut and non-Connecticut providers – providers in different health care systems within the same state or independent providers within the State also experience EMR compatibility issues.

For the foregoing reasons, the Intervenor hereby requests that OHCA deny the Applicant's motion in limine to preclude the use of data regarding out of state providers

and issue a ruling that OHCA is permitted to consider such data. OHCA is not limited by the Declaratory Ruling as the Declaratory Ruling is limited to the narrow issue of out of state ***patients not providers***. Further, OHCA has discretion to include out of state provider data and should consider such out of state provider data in its analysis and decision relating to the Application.

Respectfully Submitted,

Lawrence + Memorial Hospital, Inc.

Oral Testimony of Bruce Cummings

Hello my name is Bruce Cummings. I am the CEO and President of L+M Hospital.

I adopt my pre-filed testimony. I would like to say a few words to commence L+M's presentation and speak against the Application submitted by Backus.

While I have great respect for my colleagues at Backus and Hartford Hospitals, I believe the primary PCI program and the elective PCI program that the applicant proposes are duplicative and fundamentally flawed in their conception. Included in my pre-filed testimony is a detailed summary outlining all of the deficiencies and failure of Backus to meet the CON requirements.

L+M has been serving the region for over 100 years and staffs over 2,400 professional, technical and support personnel in nearly every medical specialty. Our mission is to improve the health of our region.

L+M is continuing to develop a strong primary and elective angioplasty program to serve patients and offer a level of care in the region that meets or exceeds national standards. In collaboration with Yale School of Medicine and the Yale New Haven Heart and Vascular Center, L+M has helped lead the way in Connecticut for angioplasty performed at a community hospital.

L+M has a successful record of performing emergency angioplasty for the past five years. At L+M, interventional cardiologists are on call 24/7 to provide the service, and they are always in close communication with paramedics and Emergency Department staff, and are ready for an emergency procedure even before the patient arrives at the hospital. Our primary and elective program is led by Medical Director, Dr. Brian Cambi, a Yale School of Medicine interventional cardiologist who maintains a permanent residence in our primary service area.

As with all L+M's services, our angioplasty program is focused on providing innovative, high quality care to the community and we will make every effort to continue to do so. However, OHCA approval of any portion of the Application before them will make it dangerously difficult for L+M's program to be viable.

I would like to introduce three individuals who will speak in more detail about the various deficiencies in Backus's application. First, Dr. Brian Cambi, the head of L+M's angioplasty program will speak to the clinical problems. Second, Dr. Daniel Rissi, chief medical officer at L+M will speak to the operational and administrative flaws in the Application. Last, Seth Van Essendelft, chief financial officer, will speak to the financial concerns in the Application.

Representatives from Lawrence & Memorial Hospital appreciate the opportunity to be here today to provide detailed information outlining the reasons why the Application before you should be denied.

Oral Testimony of Dr. Brian Cambi

Good morning, my name is Dr. Brian Cambi and I adopt my pre-file testimony.

I am an Interventional Cardiologist on faculty at Yale School of Medicine and am the Medical Director of the L+ M Heart and Vascular Center in affiliation with Yale New Haven Hospital's Heart and Vascular Center. I have been running L+M's primary angioplasty program for acute MI since 2008 and more recently in 2013 have begun overseeing its elective PCI program. I live in East Lyme Connecticut and spend greater than 80% of my time on campus at L+M. Our program is the only of its kind in the state putting me in a unique position to comment on all aspects of a community PCI program.

I am here today to speak against the application submitted by Backus Hospital. While I have great respect for my cardiology colleagues at Backus and Hartford Hospitals, I believe both primary and elective PCI services that the applicant proposes are unnecessary to meet the health care needs of our community and fundamentally flawed in their conception.

In the clearest of terms, Backus should be denied its proposed primary and elective PCI services as approval would run counter to the latest clinical guidelines regarding PCI programs without on-site surgery, and as importantly, the CT Department of Health's own published report regarding statewide PCI facilities.

We all know it is critical to restore normal blood flow to compromised heart muscle for patients suffering a sudden acute heart attack. There is a large body of literature that demonstrates primary percutaneous coronary intervention (PCI) is the ideal treatment strategy for such patients provided it can be delivered in a timely fashion. It is impractical, however, for PCI centers to be available within every 30-mile radius throughout our state or our country. In fact, the 2014 update on PCI without on-site surgical backup consensus statement from SCAI\ACC\AHA has gone so far as to say establishing PCI centers within 30 minutes of each other is ***highly advised against*** as redundant PCI centers only drive quality down by creating low-volume institutions and increase cost unnecessarily for the system. Even the CT DPH 2015 report on hospital transfers of emergency coronary angioplasty patients notes, "There is no indication of unmet need in Connecticut, while there appears to be excess capacity for PCIs."

The previously mentioned 2014 update on PCI guidelines statement goes on to recommend patients presenting to a non-PCI capable facility with STEMI be transferred to a PCI capable Center providing reperfusion or door-to-balloon-time can be delivered within 120 minutes. If this cannot be accomplished, then medical therapy with fibrinolysis remains the ideal recommended treatment strategy. It is my contention that we can easily adhere to these recommendations without beginning another program at Backus Hospital, as L+M is a mere 21 minutes from Backus Hospital. This is well within the guideline recommendation of <30min drive transfer time between non-pci and pci-capable facilities.

The applicant describes their difficulty achieving reperfusion times less than 120 minutes when transferring STEMI patients to a PCI capable facility such as Hartford Hospital or Yale New Haven Hospital. Backus cites long transfer times to PCI capable centers and persistent internal difficulties in improving their "door- in- door- out times" (DIDIO) despite extensive attempts to do so as key factors contributing to their non-adherence. However, Backus fails to mention that in the last 5 years Backus has only transferred 3 patients to L+M's PCI Program, which is the closest PCI program to Backus at a mere 21-minute drive time away. Transfers to Hartford Hospital and Yale New Haven Hospital are twice as long. Currently, L+M routinely receives STEMI transfers from another non-PCI capable hospital that is farther away than Backus at 27 minutes. Not only do we achieve guideline recommended reperfusion times of less than 120 minutes in these transferred STEMIs but the median door-to-balloon time in the last fiscal year for such patients was less than 90 minutes.

Even with the applicant's inability to improve its internal efficiency, if Backus had routinely chosen to avail itself of L+M's program, I believe patient care would have been substantially improved and guidelines would have been met. L+M has no backlog and has two dedicated cardiac catheterization labs as well as the staff and resources to accommodate additional patients. Even patients in areas north and east of Backus can receive optimal cardiac care without a program at Backus if clinical guidelines are adhered to. In its application Backus describes a timeline of 50 minutes from activation to cath lab readiness. None of the patients in their service area or newly defined "angioplasty region" are longer than a 50 minute ride from a PCI facility. Therefore, it is likely that reperfusion times would be similar or better if these patients were brought to the nearest facility either in this state or neighboring ones.

The Applicant's inability to comply with the national standard DIDO time of 30 minutes (Backus's average is greater than 70 minutes) also raises concerns for heart attack patients who develop complications during their PCI procedure, should the Applicant's proposal be approved. Backus's inability to transfer patients in a timely and efficient manner will negatively impact these critically ill patients receiving timely care at a tertiary facility.

Patients suffering from sudden heart attack are critically ill and have a high mortality rate. Ideal treatment necessitates a comprehensive team approach. Backus Hospital has not cared for STEMI patients in many years. Similarly, the vast majority of acute coronary syndrome patients (non-STEMIs) have been transferred from Backus's facility. This has left many of the supporting nurses, technologists, and other medical providers largely inexperienced in dealing with this unique patient population. Similarly, in the cardiac catheterization laboratory the experience of the supporting staff is critically important. While the cath lab nurses and interventional radiology technologists at Backus have much experience in performing percutaneous interventions in PERIPHERAL blood vessels the skill set required to care for heart attack victims is quite different. One must recognize that procedures are now occurring in the vessels that surround the patient's heart resulting in a unique set of hemodynamic consequences and potential complications. Patients are often unstable and even in cardiogenic shock compared with patients

receiving an angioplasty on a blood vessel in their leg. There are also devices unique to the treatment of heart attack victims like intra-aortic balloon pumps that are quite complex and require constant monitoring in the critical care unit after the procedure. These staffing requirements are outlined nicely in Table 4 of the SCAI/ACC/AHA 2014 Update on PCI without on-site surgical backup. The applicant fails to address any of these deficiencies and in my opinion would be creating an environment of inexperienced supporting providers that may lead to unnecessary complications.

Providing PCI in a community hospital is a very rewarding experience but can be very challenging and is quite different than providing the same service in a large tertiary environment. With nearly 10 years of experience behind me, I can tell you treating critically ill heart attack victims without any house staff, fellows, or supporting physicians can be daunting. One of the keys to our success was establishing my role to serve as Medical Director and dedicated physician champion, as the guidelines recommend, who lives and works in the community in which he provides care. This has led to extremely strong relationships in the work place and created an atmosphere of trust emblematic of any successful team. Members of the team know each other extremely well. They know their individual rolls as well as their colleague's practice habits including strengths and weaknesses. This kind of intimate understanding among team members cannot be overemphasized and is vital to successful patient care in critically ill STEMI patients. Without having a Medical Director of Backus' program on site, who lives and works in the community as I do, the applicant fails to recognize this critically important component to a successful program.

Much of my remarks thus far have addressed the applicant's failure to establish need for a primary PCI program. I would like to now speak for a moment about elective PCI. By its very name this service is not emergent in nature and can be planned. Unlike acute heart attack victims these patients are stable and many are outpatients. The applicant's suggestion that time is of the essence for this group of patients is misleading and not supported by any guideline recommendation. What is discussed in detail in the guidelines, however, is rigorous criteria for facilities to safely perform PCI on elective patients and rigorous criteria for the kinds of patients that are appropriate to receive this elective treatment at a PCI center without on-site cardiothoracic surgical backup. In all the studies that examined the safety and efficacy of performing elective PCI at off-site centers, each participating site had already established primary PCI centers with high quality outcomes and low complication rates. Backus hospital has no experience in providing PCI of any kind. The guidelines warn against inexperienced operators performing elective procedures at off-site centers. The two interventional cardiologists on staff at Backus Hospital completed their training less than one year ago. Their lifetime experience performing PCI is small. One such physician, Dr. Chua Chiaco, is named as playing a significant role in the coverage of their proposed program. Asking him to perform elective angioplasty in a novel elective PCI program, in a community hospital without on-site mentorship, is warned against in the guidelines and I believe a set up for failure.

People often ask me if I get apprehensive performing PCI in heart attack victims. My answer often surprises them. While I am confident performing both procedures, it is less stressful in the emergency setting **than** in an elective setting. In sudden heart attack victims, as a physician, you are trying to stabilize an unstable patient. You are trying to save a life that otherwise is likely to be lost. In elective PCI there is always the possibility of making a stable patient unstable. It is for this reason that patients must be selected carefully in the elective environment to minimize the chance of developing a complication. L+M follows the guidelines closely and focuses on selecting low risk patients with low risk lesions, the kind of patient pool described as "the best scenario for PCI without on-site surgery." Patients who are high-risk or have lesions that are high-risk continue to be treated more effectively and safely at a tertiary facility. The Applicant fails to recognize that a significant proportion of patients are inappropriate to have their elective procedure done at a community hospital without on-site bypass capability. This has led to an over-estimation of the number of cases that could be appropriately handled at their facility. It is quite concerning that Backus has stated repeatedly that 100% of the volume from their region currently migrating to Hartford hospital will shift to Backus. This will either be an unsafe situation for many patients or is an oversight in Backus's understanding of the patient-type most appropriate to receive care at their facility. In either case, OHCA should be highly concerned.

Furthermore, Backus makes a common mistake in assuming that all non-ST elevation MI patients will be suitable for PCI. The truth is many of these patients will not. Some will require bypass surgery. Many others have their heart attacks for reasons other than obstructive coronary artery disease. Some may have myopericarditis (an inflammation of the heart muscle), some may have a cardiomyopathy such as stress induced cardiomyopathy, some may have coronary dissection, some may have congestive heart failure, and others may have demand related infarcts from the stress of other critical medical illness or arrhythmias. The overwhelming majority of these cases will not require PCI but are more appropriately treated with medical therapy.

Lastly, guidelines have recommended trying to achieve a volume of 200 cases for all PCI programs in community hospital's without on-site cardiothoracic surgery. There is a clear correlation between quality and volume with optimal quality outcomes associated with case volumes greater 200. If Backus were to be granted a primary PCI program, or an elective PCI program or both, it will significantly lower case volume at L+M. The State will then have two programs with subpar volume and in all likelihood lower quality outcomes compared with a single robust program that currently operates at L+M with appropriate volumes, high quality outcomes, and low complication rates. All this will come at a significant financial cost on an already stressed healthcare system. I fail to see how any of this is good for our patients or the health care communities we serve.

In closing I would like to drive home the following point. If our overriding objective is to improve the cardiovascular care of the region and is unencumbered by financial gain and interest in expanding market share than there is indeed no unmet need for the citizens of this region in Connecticut. The solution is to simply start adhering to the most recent updated guidelines put

out by the SCAI/AHA/ACC and those of the Connecticut Department of Public Health. If Backus had done so, and been transferring their STEMI patients to the ***nearest*** PCI facility, at L+M, optimal reperfusion times would have undoubtedly been achieved and will continue to be achieved in these patients. If we are truly interested in continuing to improve care for our citizens with heart attack, rather than investing millions of dollars into unnecessary duplicative programs, we should invest in educating our patients about the warning signs of coronary artery disease. Furthermore, significant efforts and resources should be allocated to identify STEMI patients earlier in the field by streamlining 12-lead acquisition and transmission to a PCI Center to facilitate direct transfer to that program.

I will be happy to answer any questions at the end of L+M's presentation.

S:\doc\11 5451-5500\115491 L & M Hosp re OHCA\Docs\Opposition to Backus PCI CON\Scripts (Oral Testimony)\Script for Brian Cambi - Final (3.22.16).docx

Oral Testimony of Seth Van Essendelft

Good Morning. My name is Seth Van Essendelft.

I adopt my pre-filed testimony.

I am the Chief Financial Officer and Vice President of Support Services at Lawrence + Memorial Hospital. I oversee the financial and support operations for the L+M health system, including two acute care hospitals of L+M Hospital and Westerly Hospital, and the Lawrence + Memorial Medical Group.

Thank you for the opportunity speak against the Application submitted by Backus as the Applicant's proposed primary or elective PCI services will have a significant negative financial impact on L+M's developing program.

In 2013, L+M received CON approval to establish elective angioplasty in addition to its existing primary program. L+M has been developing this program and providing outreach to neighboring hospitals including Backus and Westerly Hospital in Rhode Island. L+M has invested significant financial resources and personnel in its angioplasty program, recruiting and retaining exceptional physician, nursing and other key staff to support this worthy program. These investments include staff, technology and equipment, including two state-of-the-art cardiac catheterization labs.

If approved, the Applicant's proposal will reduce both primary and elective PCI volume at L+M. This will lead to definitive and quantifiable financial losses and threaten the ongoing viability, quality and efficiency of the L+M program. Even approval of a primary program alone at Backus will have a significant adverse financial impact on L+M's developing program. Although Backus went through great lengths to contrive a segmented service area and articulate that there would be no negative implications to other existing programs, the facts do not support this assertion. For example, they carve out towns from the "Angioplasty Region" that are clearly within overlapping areas of L+M's and Backus' existing primary service areas. A credible review based on L+M patient origin data indicates that 25 to 30 percent of the existing L+M program volume is at risk if Backus' Application is approved and there is high probability that volume loss will be much greater for L+M. This risk is due to the existing overlapping service areas combined with the steerage leverage that Backus possess as part of the Hartford HealthCare System. At the low end of the range, L+M's incremental losses are expected to be in excess of $1 million given the significant fixed cost nature of the program and L+M investments already made.

While this negative financial impact will be felt acutely at L+M, it is not limited to our hospital. There will be a negative impact to the financial strength of Connecticut's health care system in general. Connecticut hospitals are facing serious financial challenges leading to consolidation and cutting of programs, even essential services and safety net programs. It is imperative that hospitals carefully plan strategic investments. In this case, Backus has proposed a very costly solution to an unneeded healthcare service. Rather than create a duplicative service, Backus as a sponsoring hospital could opt for a simple solution of leveraging existing technology already

deployed within the EMS system to more quickly and effectively identify and route appropriate patients directly to L+M. As evidenced in early commentary, cases from the L+M catchment area that should already be serviced by L+M's program are being subverted and transferred to Hartford Hospital. Despite being nearly double the transit time, Backus patients are being transferred to Hartford Hospital due in part to Backus's alignment within the broader Hartford Healthcare System.

If approved, primary PCI or elective PCI services at Backus will adversely impact health care costs, quality and sustainability. As my colleagues have addressed, the addition of duplicative and costly primary or elective angioplasty services at Backus Hospital is not carefully planned as Backus has not demonstrated public need or adequately identified the service area. As it is unlikely that Backus will reach its projected utilization figures without significant financial strain to L+M's developing program, Backus is doing a disservice to the residents of this state by directing scarce resources to a program that will offer more harm than benefit, all while weakening the existing quality and patient care of the previously approved program at L+M.

Based on the clear showing of unprofitability of the proposal, which appears aggressive in its assumptions, and the negative financial impacts to L+M, other angioplasty programs and the state as a whole, it is questionable why Backus is seeking approval of these services. I am confident that OHCA will consider the lack of financial viability in this proposal and deny both the primary and elective angioplasty requests.

S:\doc\11 5451-5500\115491 L & M Hosp re OHCA\Docs\Opposition to Backus PCI CON\Scripts (Oral Testimony)\Script for Seth Van Essendelft - Final (3.22.16).docx

Oral Testimony of Daniel Rissi, M.D.:

Hello my name is Dr. Daniel Rissi and I adopt my pre-file testimony.

I am the Vice President and Chief Medical and Clinical Operations Officer at L+M. I oversee medical affairs and clinical operations, but I have also managed the strategy and planning functions at L+M.

I would like to address the administrative and operational flaws in Backus Hospital's CON application.

While my pre-file testimony, as well that of my colleagues, calls into question most of the rationale put forth by Backus' CON, I need to highlight some key deficiencies for OHCA's consideration.

If approved, Backus's application will have far reaching negative implications for L+M. Backus has not clearly defined the patient population to be served and, therefore, its volume projections are highly suspect. Backus has used a contrived service area which it calls the "Angioplasty Region." Clearly, with a target volume to achieve, the applicant has created a made up service area merely in an attempt to hit minimum thresholds established by national clinical experts. Backus fails to use the primary service area based on its own discharge data and as has been historically defined for purposes of OHCA. The "Angioplasty Region" is even more expansive than the market Backus's primary and secondary service areas based on its own community health needs assessment. The "Angioplasty Region" does not include certain towns in the southern region of its PSA, presumably to downplay the tremendous harmful impact that even approval of just Primary PCI will have on L+M's developing PCI program.

The most important point that should not be lost is that 95% of this Angioplasty Region is already within or nearly within the national guidelines for travel time. Specifically, one half of the towns in the Angioplasty Region are within 30 minutes of an existing PCI capable facility and nearly all of the other half are closer to another PCI facility than Backus or within a few minutes of another PCI capable facility.

Of equal importance, regardless of how the service area is defined, Backus has not demonstrated a clear public need for primary or elective PCI services. All data and research put forth by national experts and the CT DPH have shown PCI volume declining and have projected further declines in large part due to enhanced medical management, alternative therapies, and other preventative steps. Backus's 24% growth in angioplasty services over the next few years is a complete overstatement based on all available leading research, guidelines, and Connecticut data.

Backus paints a picture of the "Angioplasty Region" that is in contrast to the actual statistics of the composition of its residents. For example, despite Backus's claim, the "Angioplasty Region" is not older. The percent of residents aged 45+ is exactly the same as Connecticut's

average age. Moreover, according to Backus's sources, the percent of residents 65+ in the Angioplasty Region is less than Connecticut's rate – 15% vs. 16%. So clearly there is a disconnect between Backus's assertions regarding the region and the statistical data of the area. The Applicant also suggests the "Angioplasty Region" has a "low socioeconomic status" and high percentage of households with median incomes less than $50,000 which translates into high prevalence for coronary heart disease. This is untrue. According to data from the Connecticut Economic Resource Center (CERC), only 2 of the 28 towns in the Angioplasty Region or in Backus's primary service area, have median incomes of less than $50,000. Backus is incorrect in its assessment of the income levels of its contrived market, and also incorrect in its use of the data. As noted in the April 2015 CT DPH report titled "Burden of Cardiovascular Diseases in Connecticut," increased prevalence of coronary heart disease is tied to annual incomes of less than $25,000, not the $50,000 Backus references. So clearly there is no correlation that can be made between the household income of the region and increased need for PCI services.

Also, according to the Eastern Region Community Health Assessment provided by Backus in its CON application, the Eastern Connecticut region actually maintains the fastest ***decreasing*** heart disease mortality rate in the State, despite the claim by Backus that this area is completely underserved. Additionally, Backus states to OHCA that high blood pressure, diabetes and high cholesterol are high in the area, but fails to openly share that patients in the market have similar or better statistical rates for these conditions compared to the State or to the Nation, and that residents in the "Angioplasty Region" are managing their condition by taking action to control these issues. A close look at the data provided in the Backus CON for the Eastern Region, which L+M has analyzed and provided in pre-file documentation, clearly shows these comparisons.

National guidelines are ***advising against*** the very program Backus is proposing, and the CT DPH has stated there is no unmet need for PCI in the state. Multiple PCI centers that are duplicative have been shown to degrade quality by creating low-volume centers. Research has emphasized the logical placement of PCI centers, and a more regional approach to STEMI care. National studies support a focus on pre hospital care and rapid transfer from non-PCI facilities to PCI-capable facilities. The CT DPH's October 2015 report on angioplasty patients confirms this by stating very clearly "that because of declining PCI volumes there should be greater focus on ***system*** level of care for STEMI patients," not more PCI centers. Initiatives like Connecticut's Mission Lifeline have supported such approaches. Although frequently referenced in Backus's arguments, the OEMS 2012 guideline does not take into consideration the very recent and best expert opinion regarding PCI services. While the OEMS 2012 guideline has improved care for many patients by ensuring timely access to PCI for STEMI patients, it is inappropriate to use this one document as the basis for another PCI center in Connecticut, with all the new research, guidelines, and expert opinion that indicate Backus's program is duplicative and not in the best interest of patients.

Backus's proposal is not consistent with national or Connecticut standards and guidelines. Backus does not abide by the established ACCF/AHA/SCAI Guidelines adopted by OHCA,

which discourage the establishment of duplicative services within a 30-minute transfer time. Further, the same guidelines do not support the development of a directly competitive program. These Guidelines specifically state that competitive programs are not in the best interest of the community. It is undeniable that angioplasty services at Backus will directly compete with L+M's establishing primary or elective angioplasty program. Backus has estimated that 51 angioplasty cases were from the Backus OHCA-defined service area- this will be a significant loss to L+M.

Backus's application does not meet the requirements for establishing primary or elective angioplasty services on any level and therefore should be denied.

A Certificate of Need Application by
The William W. Backus Hospital and
Hartford Hospital

Docket Number: 15-32031-CON

RULING ON MOTION IN LIMINE FILED BY THE WILLIAM W. BACKUS HOSPITAL AND HARTFORD HOSPITAL AND OPPOSITION THERETO FILED BY LAWRENCE + MEMORIAL HOSPITAL, INC.

On March 22, 2016 The William W. Backus Hospital and Hartford Hospital (collectively referred to herein as the "Applicants") filed a motion in limine to preclude use of data regarding out-of-state PCI providers. On March 23, 2016 Lawrence + Memorial Hospital, Inc. ("Intervenor") filed an opposition to the Applicants' motion.

After careful consideration of the Applicants' motion and the Intervenor's objection, the Office of Health Care Access hereby orders the following:

The Applicants' motion is hereby DENIED;

The Intervenor's objection is hereby SUSTAINED.

DEPARTMENT OF PUBLIC HEALTH	:	
OFFICE OF HEALTH CARE ACCESS	:	**DOCKET NO. 15-32031-CON**
	:	
	:	
IN RE: THE WILLIAM W. BACKUS HOSPITAL AND HARTFORD HOSPITAL'S CERTIFICATE OF NEED APPLICATION TO ESTABLISH A PRIMARY AND ELECTIVE PERCUTANEOUS CORONARY INTERVENTION PROGRAM AT BACKUS HOSPITAL	:	**April 1, 2016**

THE WILLIAM W. BACKUS HOSPITAL AND HARTFORD HOSPITAL'S LATE FILE INFORMATION

At the March 23, 2016 public hearing in this docket, The William W. Backus Hospital and Hartford Hospital (the "Applicants") were asked to provide the number of zip codes within the Angioplasty Region that currently have access within a 30 minute drive time to a PCI capable facility including out-of-state providers.

Applicants' Response:

There are 38 zip codes within the Angioplasty Region, which aggregate to 26 towns. Table 1 below identifies the 2015 population for each zip code, the current closest PCI-capable facility and the subsequent distance (in miles) and drive time (in minutes) to the PCI-capable facility.

Analysis of Table 1 clearly demonstrates the following 7 key points:

1. 71,189 (31%) individuals currently have access to a PCI-capable facility within 30 minutes, while **160,230 (69%) residents of the Angioplasty Region do not**. Importantly, included within the 71,189 individuals who currently have 30 minute access to a PCI-capable facility are 18,035 residents who must travel out-of-state for care to meet this standard.
2. 9 of the 38 zip codes (24% of zip codes within the Angioplasty Region) currently have access to a PCI-capable facility within a 30 minute drive. These zip codes are highlighted in yellow in Table 1. However, **76% of the Angioplasty Region zip codes do not have access within 30 minutes** as the standard of care dictates.
    - 9 of the zip codes aggregate to 6 towns: Lebanon, North Franklin, Thompson, Bozrah, Norwich, and Putnam. As indicated above, these 9 zip codes represent 31% of the total 231,419 Angioplasty Region population.
    - **3 of the 9 zip codes mentioned in the previous bullet must leave the state to seek care within 30 minutes** (North Grosvenordale, Thompson, and Putnam). These 3 zip codes represent 25% of the 71,189 individuals with 30-minute access today, or 18,035 residents.
3. 14 of the 38 zip codes (37% of the zip codes) have an **out of state provider** as the closest PCI facility.
    - 11 of the 14 zip codes that have an out of state provider as the closest PCI provider are **also outside the 30 minute optimal drive time** (Brooklyn, Danielson, Dayville, East Killingly, Pomfret Center, Quinebaug, Woodstock &

Woodstock Valley, Moosup, Sterling, and Voluntown). **These zip codes represent 51,722 or 22.3% of the entire Angioplasty Region.**

- As discussed above, the remaining 3 of the 14 zip codes (North Grosvenordale, Thompson and Putnam) are within 30 minutes to a PCI capable provider but must travel out of state to seek services. These zip codes represent approximately 8% of the population of the Angioplasty Region.

4. Lawrence + Memorial Hospital ("L+M") is the closest provider to 16 zip codes within this region today, however **only 6 of these 16 zip codes have access to L+M within 30 minutes. The remaining 10 zip codes must travel more than 30 minutes to L+M for care**.

   - Backus would be the closest provider to all 16 of these zip codes.
   - If Backus receives approval to establish PCI services, the drive time for the 6 zip codes (53,154 residents) within 30 minutes of L+M today would be significantly improved to a drive time between 2-15 minutes. The drive time for the remaining 10 zip codes **(49,325 residents) would be improved from greater than 30 minutes to a 12-30 minute drive time**. The establishment of this service at Backus will optimize the current standard of care for more than 102,000 residents of the Angioplasty Region.

5. **Backus Hospital is closer to all of the 38 zip codes, or 231,419 residents, than L+M.** The proximity of these zip codes to Backus will improve quality and outcomes, and will provide the residents of this Region with the same standard of care enjoyed by residents of the L+M region today.

6. If Backus Hospital were to start PCI services, it would be the closest provider to 23 of the 26 towns or 88% of the towns within the Angioplasty Region, **equating to 92% of the population of the Angioplasty Region.**

   - Putnam, Thompson and Woodstock are closer to out of state providers.

Table 1

			Nearest PCI Capable Facility					Backus Hospital		Lawrence and Memorial Hospital	
ZIP Code	City	2015 Population	Nearest PCI Capable Facility	Nearest Facility State	Distance (miles)	Drive-Time (minutes)	Within 30 Minutes?	Distance (miles)	Drive-Time (minutes)	Distance (miles)	Drive-Time (minutes)

STATE OF CONNECTICUT

DEPARTMENT OF PUBLIC HEALTH

OFFICE OF HEALTH CARE ACCESS

THE WILLIAM W. BACKUS HOSPITAL

ESTABLISHMENT OF A PRIMARY AND ELECTIVE PCI PROGRAM AT THE WILLIAM W. BACKUS HOSPITAL

DOCKET NO. 15-32031

MARCH 23, 2016

9:52 A.M.

DEPARTMENT OF PUBLIC HEALTH
410 CAPITOL AVENUE
HARTFORD, CONNECTICUT

POST REPORTING SERVICE
HAMDEN, CT (800) 262-4102

. . .Verbatim proceedings of a hearing before the State of Connecticut, Department of Public Health, Office of Health Care Access, in the matter of The William W. Backus Hospital, Establishment of a Primary and Elective PCI Program at The William W. Backus Hospital, held at the Department of Public Health, 410 Capitol Avenue, Hartford, Connecticut, on March 23, 2016 at 9:52 a.m. . . .

HEARING OFFICER KEVIN HANSTED: Good morning, everyone. This hearing before the Office of Health Care Access, identified by Docket No. 15-32031, is being held on March 23, 2016 to consider The William Backus Hospital's application for the establishment of a primary and elective PCI program at The William Backus Hospital.

This public hearing is being held pursuant to Connecticut General Statutes, Section 19a-639a, and will be conducted as a contested case, in accordance with the provisions of Chapter 54 of the Connecticut General Statutes.

My name is Kevin Hansted, and I have been

designated to serve as the Hearing Officer for this matter.

The staff members assigned to assist me in this case are Kaila Riggott, Jessica Schaeffer-Helmecki, Olga Armah, Brian Carney and David Fernandes. The hearing is being recorded by Post Reporting Services.

In making its decision, OHCA will consider and make written findings concerning the principles and guidelines set forth in Section 19a-639 of the Connecticut General Statutes.

The Applicant, William W. Backus Hospital, has been designated as a party in this proceeding. Lawrence & Memorial Hospital has requested Intervenor status and has been designated as an Intervenor with full rights in this proceeding.

At this time, I will ask staff to read into the record those documents already appearing in OHCA's Table of the Record in this case.

All documents have been identified in the Table of the Record for reference purposes. Jessica?

MS. JESSICA SCHAEFFER-HELMECKI: My name is Jessica Schaeffer-Helmecki, and, on behalf of OHCA, I'd like to request Exhibits A through O be entered into the record.

HEARING OFFICER HANSTED: Are there any objections to any of the exhibits?

MR. DOUGLAS COHEN: I have. Is O on the sheet that you passed out this morning?

MS. MICHELLE VOLPE: Yes.

HEARING OFFICER HANSTED: Yes.

MR. COHEN: Okay. I also have an additional document for the record, which is a letter from a patient, Irene Cardinal(phonetic), so if I could pass that around now?

HEARING OFFICER HANSTED: Sure.

MR. COHEN: I have copies for everyone.

HEARING OFFICER HANSTED: Okay.

MS. VOLPE: Will Ms. Cardinal be here to --

MR. COHEN: No. This is not a -- she's not part of testimony. It's just a letter of support.

HEARING OFFICER HANSTED: Just a letter of support. Okay and did you want to enter that as an exhibit?

MR. COHEN: No. Just a letter of support in the record.

HEARING OFFICER HANSTED: Attorney Volpe, do you have any objection?

MS. VOLPE: I don't have any objection, no.

HEARING OFFICER HANSTED: Okay, thank you. That will be entered into the record, but not an exhibit.

MR. COHEN: Thank you.

HEARING OFFICER HANSTED: You're welcome. Attorney Volpe, do you have any objections to any of the exhibits in the record?

MS. VOLPE: No. We're good with adding N and O and discussing it at the next break.

HEARING OFFICER HANSTED: Okay.

MS. VOLPE: Thank you.

HEARING OFFICER HANSTED: Thank you. And, at this time, would all the individuals, who are going to testify, even if you're not sure you're going to testify, please stand, raise your right hand and be sworn in by the court reporter?

(Whereupon, the parties were duly sworn in.)

HEARING OFFICER HANSTED: And just a reminder for those folks, who were just sworn in. When you testify today, just please state your full name for the record before you testify for purposes of the court reporter. I appreciate that.

And, first, let me just tell everyone. I know this is a small room. There's a lot of people in here. It's going to get hot, even though you may not be hot yet. Feel free to take off your jackets if you need to. If you want to step out just to cool off. If anybody needs a break, just let me know. I'm happy to do so.

We're going to change up what we usually do. There was a motion in limine filed by the Applicant in this matter and, also, an objection thereto, filed by the Intervenor.

I have not made rulings on either of those, and, so, what we'll do this morning is we'll hear presentations from both the Applicant and the Intervenor.

After that, any individuals from the public, who would like to give comment or public officials, may do so at that time.

Then we will take a short break, so everyone could review the motion in limine, as well as the objection, and, after that break, we'll come back and hear argument on the motion and the objection. Is that okay with everyone?

MS. VOLPE: That's acceptable to us.

MR. COHEN: No objection.

HEARING OFFICER HANSTED: No objection? Okay. Okay, so, we'll proceed in that manner, and, the Applicant, you may proceed at this time with your initial presentation.

MR. COHEN: Okay. As an initial matter, some administrative issues. The first, we have two demonstrative exhibits. These are in the application or the completeness questions. They're identical to what's in there.

We don't need to have these identified as exhibits, but they're just demonstrative exhibits for our witnesses. They're identical to what's already in the record, so I just wanted to point that out to you.

HEARING OFFICER HANSTED: Okay. Before you proceed, Attorney Volpe, are you okay with that?

MS. VOLPE: I don't have an objection to those, but to the extent they're going to be referred to, if you could provide the page reference in the application to us now? We can't see that from here.

MR. COHEN: This one is completeness response, page 1450. It's entitled Connecticut PCI and non-PCI hospitals average time to transfer to another facility for an acute coronary intervention, and this is completeness response, page 1448, and there's no title.

It's just a map of 30-minute drive times map, and, again, that's in the completeness questions.

HEARING OFFICER HANSTED: Thank you, counsel.

MS. VOLPE: I just have one question on the map.

HEARING OFFICER HANSTED: Sure.

MS. VOLPE: Is there a source for that? What's the primary source?

MR. COHEN: Yeah. It's 3d Health, and you can Cross-Examine him on that when he gets to testify on it.

HEARING OFFICER HANSTED: Is the source cited in the application?

MR. COHEN: I believe it is.

MS. VOLPE: Yeah, I didn't note it. That's why we asked. I don't know that it's on the page, or, if it is, the print was so fine it wasn't readable by my old eyes.

MR. COHEN: And then the last administrative matter is that one of our witnesses won't be here until the afternoon, Greg Allard. He's submitted a letter, submitted some support for the application. He is a non-Backus employee involved in EMS.

MS. VOLPE: And all I would ask, then, it's a letter of support. Is it going to be considered part of the Table of Record?

HEARING OFFICER HANSTED: That was going to be my question, one of two. Is he a formal witness, and will he testify and be subject to Cross?

MR. COHEN: He will be subject to Cross. He's not going to be presenting anything. He didn't prepare pre-filed testimony, will not be presenting, but we would like him sworn, and if there are questions related to EMS, as he's an expert on those issues, he can testify to them.

HEARING OFFICER HANSTED: And did you say the letter was already submitted?

MS. VOLPE: It's been submitted.

HEARING OFFICER HANSTED: It's been submitted, okay.

MR. COHEN: Yeah.

HEARING OFFICER HANSTED: Okay.

MR. COHEN: Exactly.

MS. VOLPE: So I guess my objection would be, in the event he doesn't show up and available for Cross, I mean we don't know, you know, how short or long the proceeding would go, I'd like to suggest that it not

be part of the Table of Record and it be offered as a letter of support.

HEARING OFFICER HANSTED: Absolutely. If he doesn't show up and, therefore, he's not subject to Cross, I'll accept the letter as a public comment, but not as an exhibit.

MR. COHEN: Sure. Okay.

HEARING OFFICER HANSTED: Okay, you may proceed if there are no other administrative matters.

MR. COHEN: No other administrative matters. Thank you.

HEARING OFFICER HANSTED: Okay.

MR. COHEN: With that, first, I want to thank you for your attention and for this hearing. We're going to be presenting here on behalf of Backus and Hartford Hospital application for primary and elective angioplasty, without on-site backup.

Ten years ago, if we had this application, it would have been extremely contentious, because angioplasty, without on-site surgical backup, was new, and I think Connecticut and OHCA should be commended for its actions over the last 10 or 12 years in providing these kinds of, allowing these kinds of services to be provided at a community hospital.

So, pure and simple, this application is for providing a lifesaving service to an isolated and underserved population in what people refer to as the quiet corner of Connecticut.

While other areas of the state may be saturated or over-saturated with these lifesaving angioplasty services, that population in our angioplasty region east of the Connecticut River is not over-saturated, and our witnesses will talk about that today.

We have a compelling case for the need for these services, and that need will not impact in any significant manner the L & M program. This is not a shift of patients from L & M to Backus. That's very important for you to consider.

Our witnesses will outline in our testimony today the exhaustive efforts and study that we've made in putting this application together, in addressing each and every question that OHCA has raised, and we're prepared to discuss our responses today.

Importantly, this is not an isolated freestanding program, like some others, but is a part of Hartford HealthCare's Cardiovascular Institute.

Our interventionalists are high-volume providers, with excellent outcomes and a lot of

experience. Our staff is well-experienced and trained, and, together, they'll bring this excellence, diligence, procedures and attention to detail to this program.

Our population is sicker than the rest of the state, and, as we'll show, the rates of angioplasty are much lower in our angioplasty region than in the rest of the state.

Why? And that's a question that you, as OHCA, have to answer today. We will answer that question and provide a solution to this different standard of care for this population.

With that, I give you David Whitehead, who is the Senior V.P., Chief Strategy and Transformation Officer.

HEARING OFFICER HANSTED: Mr. Whitehead, I'm going to take all witnesses up here, just to make it clear who is speaking as a witness.

MR. DAVID WHITEHEAD: Oh, sure. Well, good morning.

HEARING OFFICER HANSTED: Good morning.

MR. WHITEHEAD: And thank you for your time. My name is David Whitehead. I am the Chief Strategy and Transformation Officer for Hartford HealthCare, and I would like to adopt my pre-filed

testimony.

HEARING OFFICER HANSTED: Thank you.

MR. WHITEHEAD: I'm going to introduce some key themes, and then, as you have seen a number of my colleagues, will come forward and elaborate on their testimony.

I'm not going to read my testimony, and I've coached them to do the same in this process, because I know that you've taken the time to look at it already.

The real issue here is access to an area currently served by Backus. That includes three towns designated as health professional shortage areas and 11 towns designated as medically underserved areas.

It is also an area high risk for coronary artery disease, due to the high level of risk factors prevalent in this region's population.

There is a high rate of obesity, diabetes and smoking, all factors resulting in projected increases and the need for and utilization of cardiovascular services in this region.

Social determinants of health, such as low socioeconomic status, high rates of underinsured and uninsured, and a high population to physician ratio perpetuate the disease burden in this area.

Limited access to PCI services contribute to the current rates of emergency PCI and elective PCI interventions for residents in this rural part of the state being significantly below state and national levels.

As OHCA is aware, this is not the first investment in this region by Backus or Hartford HealthCare. In 2012, Backus established a full service, 24/7 satellite emergency care center in the Town of Plainfield.

The center of this isolated medically underserved geographic region, a need was revealed through careful market analysis. A sound strategy to meet community need was developed and approved by OHCA on December 3, 2010 under Docket No. 09-31503.

The methodology used in that application to identify a gaping hole of emergency services in an emergency service region is the same methodology used to define the angioplasty region.

I would ask for your approval of this application, based on the clear public need that’s been demonstrated in this application, but, more importantly, for the 230,000 residents, who reside in this isolated, undisturbed geographic region, so that they can have

improved access for this lifesaving care. That will conclude my testimony.

HEARING OFFICER HANSTED: Thank you, Mr. Whitehead.

MR. WHITEHEAD: And, with that, I would like to introduce Mariane Carna, who is executive lead for the Hartford HealthCare Heart and Vascular Institute.

HEARING OFFICER HANSTED: Good morning.

MS. MARIANE CARNA: Good morning. My name is Mariane Carna, and I adopt my pre-filed testimony.

HEARING OFFICER HANSTED: Thank you.

MS. CARNA: Thank you for your time and attention this morning. It’s an honor to be here.

My role with Hartford HealthCare is the Vice President of the Heart and Vascular Institute. I encourage the team to recognize that, although we are looking at primary and elective angioplasty, that this is part of a continuum of care that we are looking to build with multidisciplinary teams across our organization.

My role has been, I’ve been there for five months now, is to leverage the current resources that we have at our tertiary care center, so looking at Backus as our region this will be an extension of expertise that we currently have at our main medical center with high

volume operators under the Institute's guidance and direction.

We have developed a co-management model, so I have physician experts that are at my right leading the Institute under the direction of a quality infrastructure that will also be served as managing the direction of the Backus program in the east, so this is not, in our minds, a new program, but an extension of a current service area that we have.

You'll be hearing from our experts in our clinical community, Dr. John Foley and Dr. Paul Thompson, who are our physician leads in that area.

In addition to the elective in the PAMI(phonetic) program, we're also looking to build other services throughout the continuum as primary cardiology, vascular surgery, electrophysiology, so that patients will have access to the full spectrum of services that we offer at Hartford HealthCare.

So I appreciate your time and attention this morning. I look to introduce Bimal, who is our President of the East Region.

HEARING OFFICER HANSTED: Good morning.

MR. BIMAL PATEL: Good morning. My name is Bimal Patel. I'm the President of the East Region,

Senior Vice President, Hartford HealthCare. I adopt the pre-filed testimony.

HEARING OFFICER HANSTED: Thank you.

MR. PATEL: As the President of the East Region, I sleep and I wake up looking at the map, more than 200,000 people living, which is 6,000 rooms like this, distributed over that large geography, and think about what we for the care and what we do for the access.

It is not about just one hospital. It's not just about a small region or small town. It's about East Region of Hartford HealthCare, and I'm responsible for the care that we render and provide, not just within cardiovascular, but across the other service lines, as well.

So the epicenter for our care that we render in East Region is not Norwich. It's beyond that. It's above that. And I think the circle that you see kind of describes that we have that responsibility as Hartford HealthCare.

We have two hospitals in our service area, Windham Hospital and Backus Hospital, and we have Plainfield Emergency Center, and we continue to develop a variety of different access points that are ambulatory in nature and taking the care of patient needs.

The importance of today, we can talk about economics, case mix index base cost for care for discharge. We talk about profitability of our organization versus other organizations. Hands down, we've beaten all those (coughing), but I'm not here to talk about that.

We have experts through the case on clinical bases and on economic bases, etcetera. This is beyond economics. It is about providing access and it's providing care to the community.

It's a clear public need. Submitted information clearly states that, that compared to Connecticut overall, Hartford HealthCare's East Region and Hartford HealthCare's Backus, in particular, has poor numbers, in terms of healthcare outcomes.

Our population we serve is not impacted equally. They are disadvantaged, and I'm here to represent those 200,000 people today in front of you, as your authority to have access to care and my authority or my responsibility to provide the care. I think we've got to really look at this in the mirror and say how can I go back to 200,000 people and tell them that we can't have the same outcome for access to care with the rest of the Connecticut population?

So I humbly support and put these efforts in front of you this morning, as the leader of Eastern Connecticut Healthcare, that you would grant us an access that what we've asked here.

And, with that note, let me introduce our leader for Chief in East Region's Cardiology, Dr. John Foley.

HEARING OFFICER HANSTED: Thank you.

MR. PATEL: Thank you.

HEARING OFFICER HANSTED: Good morning.

DR. FOLEY: Good morning. Excuse me. I have a little bit of a cold.

HEARING OFFICER HANSTED: That's fine.

DR. FOLEY: I won't touch the microphone, nor breathe on anybody.

HEARING OFFICER HANSTED: 'Tis the season.

DR. FOLEY: My name is John Foley. I'm currently the Director of the Cardiovascular Service Line for the Hartford Medical Group and Chief of Cardiology at Backus and Windham Hospital.

I really appreciate you spending your time today meeting with us.

I have filed testimony previously and would like to adopt that for the record.

HEARING OFFICER HANSTED: Thank you.

DR. FOLEY: I'm going to reference notes, so it keeps me on track. I hope I'm a better doctor than presenter at hearings.

My role, should we be successful in getting the cath lab, will be to work with Dr. Kiernan and members of the Hartford Hospital angioplasty team to implement any of the strategic and operational goals that we need to get this program started.

We are not, and you've heard this before and it will be a theme, we're not in a vacuum. We are working really as an extension of Hartford Hospital, but when I think about my patients, the people that I take care of, and it's been mentioned earlier, compared to the general people in Connecticut, the population group they're sicker.

They have more hypertension, higher rates of smoking, higher rates of diabetes, obesity, inactivity, and, overall, the mortality is worse than the rest of the state.

It's been said that the rates of angioplasty have decreased, and, certainly, in some areas of the country, perhaps even the state, that's true, but if you look at the Hartford Hospital volumes over the

last two years, we've seen increases in the number of procedures performed, so, from the Hartford HealthCare perspective, we don't see that lack of volume.

When you consider the angioplasty region, though, and you compare the fact that they're sicker and yet their rates for angioplasty and PCI services are a lot lower, 18 percent compared to statewide for primary PCI and eight percent lower than national, when you look for elective, it's worse, 19 percent compared to the state and 40 percent compared to national.

So, you know, if the patients are sicker, the obvious question is why are they getting fewer PCIs, and I think there's one word, and it's access, which is really the mission for us today.

Why are their rates lower? Well Hartford HealthCare is doing more than just putting forward a CON for a cath lab to improve access.

If you look in the Windham community, and you'll see the maps, a very sick population group and very needy, in terms of what they need from services. We are increasing the footprint for cardiology in Windham by increasing office space.

The urgent center at Plainfield has been talked about. The volumes that were originally predicted

in that application have been more than doubled, so I think that that's been a huge success and has shown that Plainfield is an important area for care.

As such, in June, we're going to be opening our newest cardiology office in a building adjacent to the Plainfield walk-in, and we'll have a very busy cardiology presence there.

And finally, in June, the one and only cardiology practice that currently is in Putnam, there are three cardiologists that will be joining the Hartford medical group, and they'll be part of my practice, again, working within the region, so those physicians will be referring, and their patients will be taken care of.

Looking at the map of Windham County, with a very high mortality and a low rate of access and the map showing that the northeast corner of Connecticut is outside of a drive time clearly to any PCI hospital within 30 minutes, so those are the patients that we're really talking about, it might be 25 or 30 minutes from a small fringe or region in Norwich to Lawrence & Memorial Hospital, but we're talking about the person at the Woodstock Fair, who has a heart attack, and they will do far better stopping at Backus with emergency services than continue on to any other PCI hospital.

And saying that a patient can then just go out-of-state to another hospital, whether it's Rhode Island, or Massachusetts, or whether they can go to another PCI-capable hospital, loses sight of some critical issues; long drive times to visit their loved one.

I have patients, who don't even have automobiles. Our rate of automobile ownership in our catchment area is far lower than other areas of the state. They can't even get someplace to pick up their loved ones.

Care is fragmented. There are problems with insurance. There are excess costs to the systems and families, and, frequently, when they're in those institutions, they're referred to other physicians, which then they have to follow-up with, and, so, we have failed in access to care for the angioplasty, but then they've repeatedly gone back out of network to great distances for further follow-up care.

When you look, especially in the case of a routine angioplasty that develops from a cath, so the elective PCI cases, I've taken a detailed history and physical, I know the patient well, I know their family, I've probably taken care of most of them, the decision,

once I see a lesion, as to what is best to treat that patient, is best made by the person, who knows them well and not necessarily on the fly in an angioplasty suite many, many miles away.

When a patient gets a catheterization at Backus and requires transfer, it brings up all the issues that I've talked about, but there are a few others.

Again, excess cost to the patient and system, the risk of vascular, excuse me, complications and bleeding, and repeat arterial puncture, which, again, leads to more cost and more risk to the patient.

I will say it again. A cardiac cath is best done by qualified doctors, who know the patient and who can make the best decision locally.

I first came to Connecticut in 1999. I trained at UMass Medical Center, so I'm familiar with UMass. I do cardiac catheterization. At that point, I had to bring my patients to Lawrence & Memorial to do catheterizations. We did not have a program and they did.

At that time, you know, it was an inconvenience to the patients. There were extra costs, communication issues, and, quite frankly, the patients did not like to travel. It was difficult for them, and

many opted not to go.

Soon, Backus applied to OHCA and was granted privileges for diagnostic catheterizations, and I think our record will show that it's been a safe and effectively-run program over the years.

OHCA was presented with a CON request by Lawrence & Memorial for elective angioplasty. Their physician lead operator at the time, who, by the way, has recently left Lawrence & Memorial and has joined our cardiology practice in Norwich, was anything but a high-volume operator, and, yet, that program was successful, and the outcomes were good, and they later went on to do elective PCI.

I think OHCA was out in front. There were some areas of the country that had done it, not a lot, but OHCA saw the merits of elective PCI in a hospital, who did emergency plasty.

So the experiment has been done, you've already seen it, and it's worked. We have a sicker population group, who I've hopefully shown that or will show that, and these patients will be cared for in what will be an extension of the cardiac cath lab at Hartford Hospital. We bring to the table all of their expertise and many years of experience, including their high volume

case mix.

I'll conclude by saying that I have frequently been at the bedside or in an exam room talking to patients, talking to them about a transfer to a hospital further away for elective catheterization, and watched tears break out, because they had no idea how they were going to get there, or get home, or how they're going to visit their loved ones.

I remember vividly an 85-year-old man, who was in tears that it would be the first time away from his wife for a night in 60 years.

I think we can do better than this. This is an application submitted after years of thought and careful deliberation. We need OHCA's support to build a PCI program for those patients, who continue to go without.

I thank you very much for your time, and I look forward to answering any questions later. I'd like to introduce Dr. Paul Thompson, who is the Chief of Cardiology at Hartford Hospital.

HEARING OFFICER HANSTED: Thank you, Doctor.

DR. PAUL THOMPSON: My name is Paul Thompson. I'm the Chief of Cardiology at Hartford

Hospital, and I'm also the Medical Director of the Hartford HealthCare Heart and Vascular Institute, and where I'd like to go is just take a few minutes to show you why we think that this program is an integrated and integral part of our overall Heart and Vascular Institute.

So a little bit about me. I've been at Hartford Hospital for 19 years, I've been Chief of Cardiology at Hartford Hospital for the past 10 years, and, over that period of time, we've grown from five employed full-time physicians to where we have 21, and, so, our emphasis has been on growing the program and making it quality.

Over the last year, we had 139 full length publications, so we've tried to make a clinically-excellent, as well as a nationally-recognized program.

It's turned out to be an excellent program. Last year, we were eight points away from being one of the top 50 cardiovascular programs by U.S. News and World Report, and the crowned jewel of that program is actually our interventional cardiology program, which is directed by Fran Kiernan, who sits here.

These are nine geographic full-time cardiologists, who essentially do nothing, but

interventional cardiology at Hartford Hospital. They started our angioplasty program in 1982. They have done about 30,000 procedures since that time and have kept the volume that we do at about 2,000 cases per year since 2009, so a fairly steady volume of that.

They've also had a lot of experience in starting programs. For example, they helped Backus get their original diagnostic cath program. They helped Middlesex get their diagnostic cath program. Helped UConn start their full angioplasty program and, also, helped the Hospital of Central Connecticut start their primary angioplasty program.

They've also started our TAVR Program, our Mitral Valve Clip Program. My point is that they have a lot of experience in starting programs and doing them well.

I want to make the point that the Backus program is considered by us an extension of the program. It will be staffed, directed by these Hartford Hospital-based geographic full-time interventional cardiologists.

Now just a quick word about the Heart and Vascular Institute. Our goal is to integrate cardiovascular care throughout the region that we serve, so it's not just an angioplasty program, but we already

have electrophysiologists, who are working at Backus Hospital, so the point is to provide excellent cardiovascular care throughout that region.

We'd like to achieve a bunch of number ones. Number one is we'd like to have number one quality, but we'd also like to have one primary care cardiologist, one medical record, one bill for the patient, an integrated care program.

Why? Because integrated care is the best care you can provide. So, again, the point is we do not want Backus, this angioplasty program, to be viewed as a standalone program. It's integrated and integral to our overall plan for the Cardiovascular Institute.

So why primary angioplasty? Look, it's common knowledge that for a myocardial infarction, time equals cardiac muscle. Sure, there are benchmarks, in terms of 90 minutes or 120 minutes, but I think every one of us knows that the quicker you can get an artery open, the better off you are, and if you look at the maps and if you look at the material presented by others, Backus is closer, angioplasty would be quicker.

Especially, quicker is better if you can assure quality, and that's our point. This is going to be an extension of the Hartford Hospital Interventional

Program.

Why the elective angioplasty or the procedures? That's because we want to make an integrated, not fragmented, care model; one primary care cardiologist, one medical record, so the idea of transferring people in and out is fragmented care, and we don't think that's the best care that we can provide.

John has presented the issue about the positive impact on families, but our overall goal is to improve the quality of cardiovascular care that we provide in that area.

So I'm going to turn it over to Shane Foreman. That concludes what I would like to say. And he's from Diagnostic Health Care Markets and will discuss the distribution of patients, etcetera.

HEARING OFFICER HANSTED: Thank you, Doctor.

DR. THOMPSON: My pleasure.

MR. M. SHANE FOREMAN: Good morning. How are you?

HEARING OFFICER HANSTED: I'm well, thank you.

MR. FOREMAN: Good. I took your advice and I parked my jacket back there. I hope you don't

mind.

HEARING OFFICER HANSTED: Perfectly fine.

MR. FOREMAN: Good. Thank you for having me.

HEARING OFFICER HANSTED: You're welcome.

MR. FOREMAN: I'm Shane Foreman. I'm the founder and CEO of 3d Health, and I had pre-filed testimony that I'd like to adopt.

HEARING OFFICER HANSTED: Thank you.

MR. FOREMAN: No problem. I appreciate the opportunity to come. This is actually, over an 11-year period, the fifth time that I've come before OHCA around different market assessments, and I'll give you some of the examples of my previous work with similar methodologies before OHCA.

From a charge perspective, so we, as a company, completed the market assessment that is kind of the backbone of the CON application, and, at a really high level, we did a few things.

One was we wanted to test whether or not there was an underserved community or a documented need for PCI services in eastern Connecticut.

We wanted to understand, if there were, where is that? We also wanted to look at prevalence of

disease, and then treatments, and then, ultimately, we finish by taking a shot at estimating potential volumes for a program at Backus, and then, also, looked at potential impact on other facilities, so, at a high level, that's what you'll find in our detailed market assessment.

I wanted to take just a couple minutes and talk about our methodology around service area. So if you take a step backwards and think about service area, ultimately, what you're attempting to project is, for a given particular service in a particular geography, what's the likely patient base that you're going to serve?

And, so, we take a customized look at, on a service-by-service basis, and I'll talk you through some of the criteria that we consider, but when we complete market assessments, we look service-by-service, market-by-market to help understand what kind of patient draw can you expect?

So I'll give you a couple of examples. So if, in our region in eastern Connecticut, if I were looking at establishing a primary care practice, I would probably look back at the employed positions within our network and understand patient draw or patient origin for

a primary care practice, and, so, you'd probably look at like a five to eight-mile footprint on patient draw, so, obviously, it wouldn't be appropriate to say, oh, it's the Backus 75 percent patient area.

On the other end of the spectrum, if we were coming before you and saying we need additional hospital beds, I think the 75 percent service area with some immigration factor would make all the sense in the world as a particular service area.

An additional example is just outpatient imaging, so I actually came before OHCA three times from 2005 to 2007 with Danbury Hospital around outpatient imaging and took the exact same approach to customizing the service area.

As an example, in outpatient imaging, if we were going to establish an outpost and it was a freestanding center, we'd probably go look out and see what's a reasonable patient draw? Maybe a 15-mile draw.

On the other end, if we were looking at doing provider-based imaging on a hospital campus, we would probably rely more on the historic hospital definition of their service area, but really customize that to outpatient only, not consider the inpatient piece of the business.

And, so, for all three of the Danbury Hospital analyses that I completed I guess 10, 11 years ago, that's the approach that we took. That's the approach that we were successful in partnering with you guys in understanding and ultimately being approved.

Another example is probably the Plainfield project, where we worked with Backus to help understand is there an unmet need for emergency services? If so, what's a reasonable patient draw?

In that instance, we did a 15-minute drive time. Obviously, it was approved by OHCA and has been wildly successful.

So, from a service area perspective, I think what we've done in way of considering drive time makes all the sense in the world, because it's around urgency of time, in order to access this service, so I would take a very similar approach if we were talking about starting a stroke program as an example, so I think the 30-minute drive time is the best way to think about the region and define the region.

A couple things just for you to consider as you think about the service area, and then I'll move on. So this is a service that's not currently offered at Backus, and, as such, those patients aren't in the

patient origin data, so even if you wanted to rely solely on inpatient data, they're not in the inpatient data, because we don't provide those services today.

I mentioned travel time. That's a huge role here. Does not include outpatient data, so, with the two-midnight rule, there's some shift from inpatient PCI services to the outpatient arena, and understanding that and capturing that within our service area definition is an important factor.

Role of the EMS on this type of service, obviously, impact on other providers, and then, ultimately, what we did was we looked at, on a zip code-by-zip code basis, so not town-by-town, but zip code-by-zip code, what's the closest Connecticut PCI provider to that particular zip code if Backus had a program? So that's the service area.

Let's talk a little bit just about prevalence of disease. So prevalence of disease is an interesting one. So we certainly looked at volumes in the marketplace in this particular marketplace, and we understand what's happening at both the national and state level, as it relates to inpatient PCI services and, also, the shift to outpatient.

The interesting thing, though, is, if you

really want to try to get at is there a need, yes, looking at historic volumes can inform the conversation, but, obviously, if an area is underserved, all you're going to see is some level of consistency in the fact that they're not getting enough services.

And, so, what we did was we looked at a couple of different data sources, one being kind of the backbone of this was ChimeData, so we just looked at ChimeData and said what's the incidence of disease across the state and developed incidents per capita or per population, so, when we looked at is there a need and are we getting treatment within this region, it's really on a per capita basis, but it's using ChimeData, Massachusetts data, and then some national data when we wanted to look at the national point of comparison.

And when we did that, we found a couple of things. One is the incidence -- so acute MI in total is up in the region. Incidence of STEMI per 100,000 patients is about 104.3 per 100,000. As a point of comparison in the state, that's 83, and, in the nation, it's 81.9, so, obviously, STEMI per 100,000 is much, much higher within this particular region.

The preferred treatment primary PCI in the region is 18 percent below the State and eight percent

below the national, and then secondary PCI is 19 percent below the state and 41 percent below national.

When we think about who treats these patients today, so the Hartford family already treats about 50 percent of the primary PCI patients and an additional 25 percent of the secondary PCI patients, so this is already a big part of the Hartford family book of business.

When we looked at the defined region, based on the methodology that I just explained, L & M has just three percent of the primary PCIs, and this was from 2014, three percent in primary and five percent in secondary from that angioplasty region that we defined.

So, in conclusion, I'll leave you with a couple of things. One is, over the past 14 years, as the founder and CEO of 3d Health, you know, as it relates to service areas and defining service areas that make both strategic sense and prove out to be a well-representation of where patients would come from, we've probably worked with over 250 hospital and health system clients across the country and defined thousands of service areas, and, again, no one fit cookie cutter approach to this, in my opinion, makes sense and tells the story.

I think there is a clear need in this

region, so, again, completely totally understand what's happening at both a national level and a state level, but this is an isolated, underserved population, as it relates to these services.

And then, finally, impact, as you'll see from my pre-filed testimony, we believe that impact on L & M will be minimal, and that, to a large degree, these patients have already spoken, so they're underserved as it is.

L & M has a great program. If these patients wanted to go to that program, they would already be doing so, so certainly understand angst around excess capacity, but, ultimately, it's this patient population that makes those decisions, and for going on, what, eight years of operation, these particular patients have chosen not to, by and large, chose not to avail themselves of that service. Thank you.

HEARING OFFICER HANSTED: Thank you.

MR. COHEN: We have one last point, which is Dr. Kiernan is not going to present any testimony today. He's available for Cross-Examination, plus I'd like him to adopt his pre-filed testimony for you.

HEARING OFFICER HANSTED: Absolutely. If he can come up and do that now, I'd appreciate it.

MR. COHEN: Thank you.

HEARING OFFICER HANSTED: Good morning, Doctor.

DR. FRANCIS KIERNAN: Good morning. My name is Francis Kiernan. I'm the Director of the Cardiac Laboratory at Hartford Hospital, and I'd like to adopt my testimony.

HEARING OFFICER HANSTED: Thank you.

DR. KIERNAN: Thank you.

MR. COHEN: And Dr. Kiernan is available for Cross-Examination questions today.

HEARING OFFICER HANSTED: Thank you, counsel.

MR. COHEN: Thank you.

HEARING OFFICER HANSTED: Does that conclude your presentation?

MR. COHEN: That concludes our presentation.

HEARING OFFICER HANSTED: Okay. Attorney Volpe, you may proceed.

MS. VOLPE: Thank you --

HEARING OFFICER HANSTED: You're welcome.

MS. VOLPE: -- Hearing Officer Hansted. My name is Michele Volpe. I'm legal counsel for Lawrence

& Memorial, the Intervenor in this process. Yes, we're an Intervenor, but, you know, more importantly, we're a provider, and we're a provider to this community and the 230,000 patients the Applicant reports are underserved.

In all of the national data from experts and organizations specifically dealing with analyzing, studying this PCI procedure from a primary and elective perspective, as well as from this own Department's exhaustive studies and looking at these programs in our state, there's a lot of data, surveys, expert opinions that should not be overlooked when analyzing the need and access for this population.

With us here today, you know, at Lawrence & Memorial we have professionals, individuals, experts to speak about the proposal presented before you today.

Lawrence & Memorial Hospital is the only community-based hospital that is doing primary and elective PCI, so we are extremely well-versed to speak to what's needed to start and implement a program at a community-based hospital, who doesn't have surgical backup.

So we agree with my colleague, Doug, when he said, you know, 10 years ago, it would be extremely contentious and highly unlikely, however, I present to

you today that implementing a program, even a primary program, in a region with a hospital that is within 17 miles of an existing one to implement the same duplicative service, is not in the best interest of Connecticut or the patients in these communities. There's a lot of data that would run contrary to that.

Yes, patients don't like to drive. We understand that. Patients don't want to be inconvenienced, but it's not a question of inconveniencing a patient. We talk about the heart muscle. It's a question of whether patients in this region already have access within national standards to this service.

We're going to present to you today, as we have in our pre-filed testimony, that nearly half of these towns in this angioplasty region that they've created nearly half are within the national standards of a 30-minute drive time, and 95 percent of them are within a 35-minute drive time of a provider capable in already offering PCI services, both elective and primary.

That's compelling information. That's 95 percent of this region that's already being serviced in accordance with the national standards.

Some of the towns that they're stating

don’t have access to this critical service, they’re not even closer. They’re not even the closest provider for the patient in that region, so some of the common themes and backbones, as Mr. Foreman stated in his analysis, we do think that, while they don’t want to adopt the OHCA established service area and the CMS Medicare established service area and defining their service area, we think it would be very dangerous for this department and others in the state to follow a service area that doesn’t take into account the national standards, in terms of minutes and drive time. That is crucial.

Some of the other common themes are that we’re not going to see a shift in volume away from L & M. Well we’ve looked at our patient origin data from this region. We know how many patients we’re servicing from this region, and, by our own patient origin data and what’s been on file with OHCA, you know, we will easily lose 25 to upwards of 30 percent of our volume if this program were to be implemented.

So we all know that it’s not in the best interest for patients, in terms of quality, to have low volume providers in this area.

Again, all the national data, and I’ll quote, and this is an important point, this goes to the

heart of everything, and this is from the ACC/AHA expert consensus document, “Multiple low volume and partial service PCI centers within a geographic area diffuse PCI expertise, increase costs for overall health care system, and have not been shown to improve access. If the transfer time is less than or equal to 30 minutes, it is reasonable to assume that transfer to the nearest PCI center will provide reperfusion as rapidly as if it were available at the first hospital.” And reperfusion, as we know, is blood to the heart.

“The development of PCI facilities within a 30-minute emergency transfer time,” and, again, we are a mere 17 minutes away, “to an established facility is therefore strongly discouraged.”

I mean these are what the national experts are telling us. This is also evidenced in OHCA surveys and data and studies that have been conducted by this Department, so, again, common themes are that it’s not going to impact us. Of course it’s going to impact us, and it’s going to impact all patients, who go to access this service.

Having low volumes at multiple institutions with a duplicate service within the same service area is devastating, and we all know -- they say,

well, we might lose a few volume. Any number, any patients that we would lose volume for in performing this service is too many. We would purport it's too many. So we care about this region, as well.

Are there more cost-effective ways to deal with heart issues in this region, emergent heart issues? Of course there are. This office has looked at them. L & M is prepared to talk about them.

There's been studies and reports issued by the Office of Health Care Access to say it would be prudent for EMS to have 12-lead standard EKGs in EMS providers. With this, they can better detect whether or not somebody is experiencing a heart attack.

If this were to happen, they could redirect people very timely. It takes a lot of time to setup a cardio cath lab. By everyone's own admission, it could take 50 minutes or more, so we're not going to save time.

What's going to save time and what's going to help this population is outfitting our EMS providers, so we hope Mr. Allard is able to be here to address that.

This office has stated that that would be the most cost-effective way to bring services to this region.

And there's also been a common theme, that this population is sicker. We have presented in our pre-filed testimony and for the record lots of reports from the economic office in the state and others that shows that this patient population is not sicker.

There have been information in the record to say that, if the patient, if the community has income of less than $50,000, that equates to a lower health quality of the patient. Those statistics relate to less than 25,000 in annual income, and we would purport that this region is not any sicker than the rest of the state when you look at and compare it to the other regions in the state, and we have done that for everyone.

So, again, you know, our position is, and we've presented it in the pre-file and you're going to hear it today, there is not an unmet need for this service.

In fact, if this were to be implemented, it would impact existing providers, but, more importantly, it will affect quality, and we all know that volumes equate to quality. There have been a lot of smarter people than us, who have looked at this issue, in terms of the national experts, and studied it, and would argue that there is no -- that we need to strongly

discourage implementing this type of program with a hospital that has capability within such a short distance of Backus and, also, within -- the fact that nearly 95 percent of those individuals have access to a capable provider.

I know the Applicant doesn't want us to look at out-of-state providers, but that's silly. You know, Dr. Foley said, you know, the poor patient, who has a heart attack at the Woodstock Fair. Well UMass is closer than Backus to the Woodstock Fair, and Backus is not even within the standard 30-minute drive time from Woodstock, so we would argue, and as would every other national expert, that that patient should go to UMass.

With that, I'd like to start and introduce some of the Lawrence & Memorial representatives, who are here to share information about this important decision OHCA has before them.

I'd like to have Mr. Bruce Cummings, President of Lawrence & Memorial, come up and adopt his pre-file and say a few words.

HEARING OFFICER HANSTED: Sure.

MS. VOLPE: Thank you.

HEARING OFFICER HANSTED: Good morning.

MR. BRUCE CUMMINGS: Good morning, ladies

and gentlemen. My name is Bruce Cummings. I'm the President and CEO of Lawrence & Memorial Hospital. I hereby adopt my pre-filed testimony.

HEARING OFFICER HANSTED: Thank you.

MR. CUMMINGS: Thank you. I'd like to say a few words to L & M's presentation and speak against the application submitted by The William W. Backus Hospital.

While I have great respect for my colleagues at Backus and Hartford Hospitals, I believe the primary PCI program and the elective PCI program that the Applicant proposes are duplicative and fundamentally flawed in their conception.

I included in my pre-filed testimony a detailed summary, outlining all of the deficiencies and the failure of Backus to meet the CON requirements.

L & M has been serving the region for over 100 years, and we have over 2,400 professional technical and support personnel in virtually every medical specialty, and our mission is to improve the health of our region.

L & M is still continuing to develop a strong primary and elective angioplasty program to serve patients and to offer a level of care in the region that meets or exceeds national standards.

On collaboration with the Yale School of Medicine and the Yale-New Haven Heart and Vascular Center, L & M has been a leader in Connecticut for angioplasty performed at a Community Hospital without surgical back up. And we've had a very successful record of performing angioplasty, the emergency angioplasty, for the past five years.

At L & M, the interventional cardiologists are on call 24/7 to provide this service, and they are always in close communication with paramedics in the field and the emergency department staff and are ready for an emergency procedure, even before the patient arrives at the hospital.

The Medical Director for our primary and elective program is led by Dr. Brian Cambi, a Yale School of Medicine Interventional Cardiologist, here with me today. Dr. Cambi maintains a permanent residence in our primary service area.

As with all of L & M services, our angioplasty program is focused on providing innovative high-quality care to the community and will make every effort to continue to do so.

However, OHCA approval of any portion of the application before them today will make it

dangerously difficult for L & M's program to remain viable.

I'm going to introduce three individuals, who will speak in more detail about the various deficiencies in the Backus application. First, Dr. Cambi, the head of the angioplasty program at L & M, will speak to the clinical issues with it.

Second, Dr. Daniel Rissi, our Chief Medical Officer, will speak to the operational and administrative flaws in the application.

And, last, my colleague, Seth Van Essendelft, the Chief Financial Officer, will speak to the financial concerns in the application.

So for myself and my colleagues at L & M, we appreciate the opportunity to be here today to provide detailed information outlining the reasons why the application before you should be denied. Thank you very much.

HEARING OFFICER HANSTED: Thank you.

DR. BRIAN CAMBI: Good morning.

HEARING OFFICER HANSTED: Good morning.

DR. CAMBI: My name is, as Bruce alluded to, is Dr. Brian Cambi, and I adopt my pre-filed testimony.

HEARING OFFICER HANSTED: Thank you.

DR. CAMBI: I am an interventional cardiologist on the faculty at Yale School of Medicine, and I'm the Medical Director of the L & M Heart and Vascular Center, in affiliation with Yale-New Haven Hospital's Heart and Vascular Center.

Unlike what Dr. Foley mentioned, I just want to sort of correct one thing. I've been running L & M's primary angioplasty program for acute MI since 2008.

You'll remember that, in 2006, there was an initial foray, headed by a community-based private practitioner, who, after eight months, asked that the program be closed, then, in 2008, it was renewed, and I became Director at that time.

More recently, in 2013, after this office's approval, I've begun overseeing an elective PCI program at Lawrence.

I live in East Lyme, Connecticut, as Bruce mentioned, and spend greater than 80 percent of my time on campus at Lawrence & Memorial.

Our program is the only of its kind in the state, I think putting me in a unique position to comment on all aspects of a community PCI program.

I'm here today to speak against the

application submitted by Backus Hospital. While I have great respect for my cardiology colleagues, both at Backus and Hartford Hospitals, I believe both primary and elective PCI services that the Applicant proposes are unnecessary to meet the health care needs of our community and fundamentally flawed in their conception.

In the clearest of terms, Backus should be denied its proposed primary and elective PCI services, as approval would run counter to the latest clinical guidelines regarding PCI programs without on-site surgical backup.

As importantly, the CT Department of Health's own published report regarding statewide PCI facilities would suggest that this program is redundant and unnecessary.

We all know it's critical to restore normal blood flow to compromised heart muscle, as many have spoken to already today, for patients, who are suffering an acute heart attack. There is a large body of literature that demonstrates primary percutaneous coronary intervention PCI is the ideal treatment strategy for such patients, provided they can be delivered in a timely fashion.

It is impractical, however, for PCI

centers to be available within every 30-minute radius throughout our state or country, otherwise, every town would have a PCI Center, and you could down to Stop & Shop and get your angioplasty for a heart attack, which is simply impractical.

In fact, the 2014 update on PCI without on-site surgical backup consensus statement from SCAI, ACC and AHA has gone so far to say that establishing PCI centers within 30 minutes of each other is highly advised against, as redundant PCI centers only drive quality down by creating low volume institutions and increased cost unnecessarily for the system.

Even the CT DPH 2015 report on hospital transfers of emergency coronary angioplasty patients notes, quote, “There is no indication of unmet need in Connecticut while there appears to be excess capacity for PCIs.”

The previously-mentioned 2014 update on PCI guidelines statement goes on to recommend patients presenting to a non-PCI-capable facility be transferred to a PCI-capable center providing reperfusion, or door-to-balloon times, or restoration of blood flow to heart muscle, can be delivered within 120 minutes. If this cannot be accomplished, these guidelines suggest, then

medical therapy with fibrinolysis remains the ideal treatment strategy.

It is my contention that we can easily adhere to these recommendations, without beginning another program at Backus, as L & M is a mere 21 minutes from Backus. Michele mentioned 17 minutes, but, if my recollection serves me, it's 17 miles, 21 minutes.

MS. VOLPE: Right. Thank you, Dr. Cambi.

DR. CAMBI: Sure. This is well within the guideline recommendation of less than a 30-minute drive time, transfer time between non-PCI and PCI-capable facilities.

Concerningly, the Applicant describes their difficulty achieving reperfusion times less than the recommended 120 minutes when transferring STEMI patients to a PCI-capable facility, such as Hartford or Yale-New Haven Hospital.

Backus cites long transfer times to PCI-capable centers and persistent internal difficulties in improving their door-in and door-out times, despite extensive attempts to do so, as key factors contributing to their non-adherence to the guidelines.

An important point, though, and one that I really want to drive home, Backus fails to mention in

their application that, in the last five years, they have transferred three patients to L & M, which is the closest PCI program and a mere 21-minute drive time away. Transfers to Hartford Hospital and Yale-New Haven Hospital are twice as long.

I would say that patient outcomes would be improved, as we'd all agree, if they had been open sooner and they had availed themselves of the L & M program.

Currently, L & M receives STEMI transfers from another non-PCI-capable center or hospital, rather, that's actually farther away than Backus at 27 minutes westerly.

Not only do we achieve guideline recommended reperfusion times of less than 120 minutes in these transfer STEMIs, but our door-to-balloon time in the last fiscal year for these very same patients was less than 90 minutes.

Even with the Applicant's inability to improve its internal efficiency, if Backus had routinely chosen to avail itself of our program, I believe patient care would have been substantially improved and guidelines would have been met.

L & M has no backlog and has two dedicated catheterization labs, as well as the staff and resources

to accommodate additional patients.

Even patients in areas north and east of Backus can receive optimal care without a program at Backus if clinical guidelines are adhered to.

In its application, Backus describes a timeline of 50 minutes from activation, they get word that there's a heart attack, to cath lab readiness. None of the patients in their service area or newly-defined angioplasty region are longer than a 50-minute ride to a PCI facility.

Therefore, it's likely that reperfusion times would be similar or better if these patients were brought to the nearest facility either in this state or a neighboring one.

The Applicant's inability to comply with the national standard door-in/door-out time of 30 minutes, Backus's average is greater than 70 minutes as their exhibit attests to and actually is substantially higher than the average door-in/door-out times for other non-PCI-capable facilities in our state, also raises concerns for heart attack patients, who develop complications during their PCI procedure, should the Applicant's proposal be approved.

Backus's inability to transfer patients in

a timely and efficient manner will negatively impact these critically-ill patients receiving timely care at a tertiary facility, should the need arise for them to be transferred.

Patients, as we all know, suffering from a sudden heart attack are critically ill and have a high mortality rate. Ideal treatment necessitates a comprehensive team approach. I know this well.

Backus Hospital has not cared for STEMI patients in many years. Similarly, the vast majority of acute coronary syndrome patients, non-STEMIs, have been transferred from Backus's facility to tertiary facilities for their intervention. This has left many of the supporting nurses, technologists and other medical providers largely inexperienced in dealing with this unique patient population.

Similarly, in the cardiac catheterization laboratory, the experience of the supporting staff is critically important. While the cath lab nurses and interventional radiology technologists at Backus have much experience in performing percutaneous interventions in peripheral blood vessels, the skill set required to care for heart attack victims is quite different.

One must recognize that procedures are now

occurring in the vessels that surround the patient's heart, resulting in a brand new unique set of hemodynamic consequences and potential complications. Patients are often unstable and even in cardiogenic shock compared with patients receiving an angioplasty on a blood vessel in their leg, for example.

There are also unique devices to the treatment of heart attack victims, like intra-aortic balloon pumps that are quite complex and require constant monitoring in the critical care unit after the procedure.

These staffing requirements are outlined nicely in Table 4 of the SCAI/ACC/AHA 2014 update on PCI without on-site surgery.

The Applicant fails to address any of these deficiencies and, in my opinion, would be creating an environment of inexperienced supporting providers that may lead to unnecessary complications.

You know, providing PCI in a community hospital is a very rewarding experience, but it can be very challenging, and it's quite different than providing the same service in a large tertiary environment, like Yale or Hartford.

With nearly 10 years of experience behind me, I can tell you treating critically-ill heart attack

victims, without any house staff, fellows, or supporting physicians, can be daunting.

One of the keys to our success was establishing my role to serve as Medical Director and dedicated physician champion, as the guidelines recommend, who lives and works in the community and provides care.

This has led to extremely strong relationship in the workplace and created an atmosphere of trust, emblematic of any successful team.

Members of the team know each other extremely well. They know their individual roles, as well as their colleagues' practice habits, including strengths and weaknesses.

This kind of intimate understanding among team members cannot be over-emphasized and is vital to successful patient care in critically-ill STEMI patients.

Without having named a Medical Director of the program, who lives and works on site in the community as I do, the Applicant fails to recognize this critically-important component to a successful program.

Now much of my remarks thus far have addressed the Applicant's failure to establish need for a primary PCI program, but they're also applying for

elective program, so I'd like to speak for a moment about that.

By its very name, this service is not emergent. It's elective, so it can be planned. Unlike acute heart attack victims, these patients are stable and many are outpatients.

The Applicant's suggestion that time is of the essence in their application for this group of patients is misleading and not supported by any guideline recommendation.

What is discussed in detail in the guidelines, however, is rigorous criteria for facilities to safely perform PCI on elective patients and rigorous criteria for the kinds of patients that are appropriate to receive this elective treatment at a PCI center, without on-site cardiothoracic surgical backup.

In fact, in all the studies that examined the safety and efficacy of performing elective PCI off-site centers, each participating site had already established primary PCI centers that were well-run, with high-quality outcomes and appropriate volumes, and their diagnostic cardiac catheterization labs had an annual volume of more than 300, none of which applies to Backus Hospital.

The guidelines warn against inexperienced operators performing elective procedures at off-site centers. Now this is an awkward thing for me to speak about, because, you know, the interventional cardiologists sort of have a bond with each other that transcends things like this, but I think it's important to note that Backus Hospital mentions in their application that they have two interventional cardiologists on staff. Both completed training less than a year ago. Their lifetime experience performing PCI is small, if not, negligible.

One such physician, Dr. Chua Chiaco, is named as playing a significant role in the coverage of their proposed program. Asking him to perform elective angioplasty in a novel or a new elective PCI program in a community hospital, without on-site mentorship of a seasoned, experienced interventional cardiologist, is warned against in the guidelines and I believe a setup for failure and, quite frankly, not fair to Mike.

The other interventional cardiologist they mention as having privileges at Backus is employed by Yale and actually comes to L & M to do his elective work and I've been mentoring since he started last summer.

People often ask me if I get apprehensive

performing PCI on heart attack victims. My answer often surprises them. While I'm confident performing both procedures, it is much less stressful, in my opinion, in the emergency setting.

In some heart attack victims, these patients are dying. You're trying to stabilize them. You're trying to save a life where otherwise one would likely to be lost.

In elective patients, they're like me and you. They come to the cath lab, they have a diagnostic procedure, they were okay, and then you try to fix a blockage, and there's a chance you could take a patient that was all right and make them critically ill. That can be much more unnerving.

It is for this reason that elective patients must be selected carefully to minimize the chance of developing a complication.

L & M follows the guidelines closely and focuses on selecting low-risk patients with low-risk lesions, the kind of patient pool described as, quote, "The best scenario for PCI, without on-site surgery," end quote.

Patients, who are high risk or who have lesions that are high risk, continue to be treated more

effectively and safely at a tertiary facility like Hartford or Yale.

The Applicant fails to recognize that a significant proportion of patients are inappropriate to have their elective procedure done at a community hospital, without on-site surgery.

This has led to an over-estimation of the number of cases that could be appropriately handled at their facility.

It's quite concerning that Backus has stated repeatedly that 100 percent of the volume from their region currently migrating to Hartford Hospital will shift to Backus.

This will either be an unsafe situation for patients, or as an oversight in Backus's understanding of the patient type most appropriate to receive care at their facility. In either case, OHCA should be concerned.

Furthermore, Backus makes a common mistake in assuming that all non-ST elevation MI patients, so non-emergent patients, will be suitable for PCI.

The truth is, many of these patients will not. PCI is not the recommended treatment for some of them. Many will need bypass surgery. Many others will

have their heart attacks for reasons other than obstructive heart blockages. Some may have a condition, called myopericarditis, an inflammation of the heart muscle. Some may have a cardiomyopathy, such as stress-induced cardiomyopathy, some may have coronary dissection, some may have congestive heart failure, and others may have demand-related heart attacks from the stress of another medical illness.

The overwhelming majority of these cases will not require PCI, but are more appropriately treated with medical therapy.

Let me just say one more thing before I close. I really applaud John's comments, in terms of trying to reach an underserved population that they perceive in the far reaches of the State, and he talks about their hypertension and their lipids.

I think it's great that they're moving more services out in that direction and setting up offices, etcetera, but I think John would agree that angioplasty PCI doesn't make hypertension better. It doesn't make hyperlipidemia better. Those are more ground roots efforts with better patient education and doctors on the ground.

Lastly, the guidelines have recommended

trying to achieve a volume of 200 cases for all PCI programs in community hospitals without on-site surgery. There's a clear correlation between quality and volume, with optimal quality outcomes associated with case volumes greater than 200.

If Backus were to be granted a primary PCI program, or an elective one, or both, it will significantly lower case volume at Lawrence.

The State will then have two programs with subpar volume and, in all likelihood, lower quality outcomes, compared with a single robust program currently operating at L & M with appropriate volumes, high-quality outcomes and low complication rates.

All this will come at a significant financial cost on an already stressed health care system. I fail to see how any of this is good for our patients or the health care communities we serve.

In closing, I would like to drive home the following point. If our overriding objective is to improve the cardiovascular care of the region and is unencumbered by financial gain and interest in expanding market share, then there is, indeed, no unmet need for the citizens of this region in Connecticut.

The solution is to simply start adhering

to the most recent updated guidelines put forth by SCAI/AHA/ACC and those of this very body. If Backus had done so and been transferring their STEMI patients to the nearest PCI facility at Lawrence, optimal reperfusion times would have undoubtedly been achieved and will continue to be achieved in these patients.

If we are truly interested in continuing to improve care for our citizens with heart attack, rather than investing millions into unnecessary duplicative programs, we should invest in educating our patients about the warning signs of coronary disease, and, furthermore, significant efforts and resources should be allocated to identify STEMI patients earlier in the field by streamlining the way 12 leads are required and transmitted to PCI centers to facilitate direct transfer.

I'll be happy to answer any questions now or at the conclusion. Thanks for your attention. I know that was long.

HEARING OFFICER HANSTED: Thank you, Doctor.

DR. DANIEL RISSI: Good morning.

HEARING OFFICER HANSTED: Good morning.

DR. RISSI: My name is Dr. Daniel Rissi,

and I would like to adopt my pre-filed testimony.

HEARING OFFICER HANSTED: Thank you.

DR. RISSI: I am the Vice President and Chief Medical and Clinical Operations Officer at L & M. I oversee medical affairs and clinical operations, but I have also managed the strategy and planning functions at L & M.

I would like to address the administrative and operational flaws in Backus Hospital's CON application.

While my pre-filed testimony, as well as that of my colleagues, calls into question most of the rationale put forth by Backus's CON, I need to highlight some key deficiencies for OHCA's consideration.

If approved, Backus's application will have far reaching negative implications for L & M. Backus has not clearly defined the patient population to be served, and, therefore, its volume projections are highly suspect.

Backus has used a contrived service area, which it calls the angioplasty region. Clearly, with a target volume to achieve, the Applicant has created a made up service area merely in an attempt to hit minimum thresholds established by national clinical experts.

Backus fails to use the primary service area, based on its own discharge data, and as has been historically defined for purposes of OHCA. The angioplasty region is even more expansive than Backus's primary and second service areas, based on its own community health needs assessment.

The angioplasty region does not include certain towns in the southern region of its PSA, presumably to downplay the tremendous harmful impact that even approval of primary PCI will have on L & M's developing PCI program.

The most important point that should not be lost is that 95 percent of this angioplasty region is already within or nearly within the national guidelines for travel time.

Specifically, one half of the towns in the angioplasty region are within 30 minutes of an existing PCI-capable facility. Nearly all of the other half are closer to another PCI facility than Backus or within a few minutes of another PCI-capable facility.

Of equal importance, regardless of how the service area is defined, Backus has not demonstrated a clear public need for primary or elective PCI services.

All data and research put forth by

national experts and by the Connecticut DPH have shown PCI volume declining and have projected further declines in large part due to enhanced medical management, alternative therapies, and other preventative steps.

Backus's 24 percent growth in angioplasty services over the next few years is an overstatement, based on all available leading research, guidelines, and Connecticut's own data.

Backus paints a picture of the angioplasty region that is in contrast to the actual statistics of the composition of its residents.

For example, despite Backus's claim, the angioplasty region is not older. The percent of residents age 45 and above is exactly the same as Connecticut's average age.

Moreover, according to Backus's sources, the percent of residents 65 and older in the angioplasty region is less than Connecticut's rate, 15 percent versus 16 percent, so, clearly, there is a disconnect between Backus's assertion regarding the region and the statistical data of the area.

The Applicant also suggests the angioplasty region has a low socioeconomic status and a high percentage of households with median incomes less

than $50,000, which translates into high prevalence for coronary artery disease.

This is untrue. According to data from the Connecticut Economic Resource Center, only two of the 28 towns in the angioplasty region are in Backus's primary service area, have median incomes of less than $50,000.

Backus is incorrect in its assessment of the income levels of its contrived market and also incorrect in its use of the data.

As noted in the April 2015 Connecticut DPH report, titled The Burden of Cardiovascular Diseases in Connecticut, increased prevalence of coronary artery disease is tied to annual incomes of less than $25,000, not the $50,000 that Backus references, so, clearly, there is no correlation that can be made between the household incomes of the region and the increased need for PCI services.

Also, according to the Eastern Region Community Health Assessment provided by Backus in its CON application, the eastern Connecticut region actually maintains the fastest decreasing heart disease mortality rate in the state, despite the claims by Backus that this area is completely underserved.

Additionally, Backus states to OHCA that rates of high blood pressure, diabetes and elevated cholesterol are high in the area, but fails to openly share that patients in the market have similar or better statistical rates for these conditions compared to the state or to the nation, and that residents in the angioplasty region are managing their condition by taking actions to control these issues.

A close look at the data provided in the Backus CON for the eastern region, which L & M has analyzed and provided in the pre-filed documentation, clearly shows these comparisons.

National guidelines are advising against the very program that Backus is proposing, and the Connecticut DPH has stated there is no unmet need for PCI in the state.

Multiple PCI centers that are duplicative have been shown to degrade quality by creating low volume centers. Research has emphasized the logical placement of PCI centers and a more regional approach to STEMI care.

National studies support a focus on pre-hospital care and rapid transfer from non-PCI facilities to PCI-capable facilities.

The Connecticut DPH October 2015 report on angioplasty patients confirms this by stating very clearly that, because of declining PCI volumes, there should be a greater focus on system level care for STEMI patients, not more PCI centers.

Initiatives, like Connecticut's Mission Lifeline, have supported such approaches. Although frequently referenced in Backus's argument, the OEM's 2012 guideline does not take into consideration the very recent and best expert opinion regarding PCI services.

While the OEM's 2012 guideline has improved care for many patients by ensuring timely access to PCI for STEMI patients, it is inappropriate to use this one document as the basis for another PCI center in Connecticut with all the new research, guidelines and expert opinion that indicate Backus's program is duplicative and not in the best interest of the patients.

Backus's proposal is not consistent with national or Connecticut standards and guidelines. Backus does not abide by the established ACCF, AHA and SCAI guidelines adopted by OHCA, which discourage the establishment of duplicative services within a 30-minute time frame.

Further, the same guidelines do not

support the development of a directly competitive program. These guidelines specifically state that competitive programs are not in the best interest of the community.

It is undeniable that angioplasty services at Backus will directly compete with L & M's establishing primary and elective angioplasty program.

Backus has estimated 51 angioplasty cases were from the Backus OHCA-defined service area, and that would be a significant loss to L & M.

The Backus application does not meet the requirements for establishing primary or elective angioplasty services on any level and, therefore, should be denied.

Thank you for allowing me to testify.

HEARING OFFICER HANSTED: Thank you, Doctor.

MR. SETH VAN ESSENDELFT: Good morning.

HEARING OFFICER HANSTED: Good morning.

MR. VAN ESSENDELFT: My name is Seth Van Essendelft. I'm the Vice President of Finance and Support Services at Lawrence & Memorial, and I'm here to adopt my pre-filed testimony.

HEARING OFFICER HANSTED: Thank you.

MR. VAN ESSENDELFT: In my role at Lawrence & Memorial, I oversee the financial operations of our acute hospitals, Lawrence & Memorial, as well as Westerly Hospital and the Lawrence & Memorial Medical Group.

Thank you for the opportunity to be here today and to speak against this application submitted by Backus, as the Applicant's proposed primary or elective PCI programs will have a significant implication, as you've already heard from some of my colleagues, on the financial and quality aspects of the program already approved and established at Lawrence & Memorial.

In 2013, L & M received the CON application and approval to establish an elective angioplasty program, in addition to the existing primary program, and we've been developing this program and providing outreach to our neighboring facilities, hospitals, which include Backus and Westerly in Rhode Island.

We continue to invest significant resources in this program and personnel, which includes recruiting and retaining exceptional physician services, nursing and other key staff there to support this worthy program.

These investments also include technology and equipment, including two state-of-the-art cardio cath labs at L & M. If approved, the Applicant's proposal will reduce both primary and elective PCI volume at L & M.

This will lead to a definitive and quantifiable financial negative implication to our existing program and threaten the ongoing viability, quality and efficiency of that program.

Even approval of just the primary program alone at Backus will have a significant adverse impact on L & M's developing program.

Although Backus went through great lengths to contrive a segmented service area and articulate that there would be no intended negative implications to other existing programs, the facts simply don't support that assertion.

For example, they carve out towns from the angioplasty region, which actually already fall clearly within overlapping primary service areas of both hospitals.

A credible review, based on L & M's patient origin data, as also mentioned earlier by our attorney, would indicate that at least 25 percent, but

much higher, is possible to be pulled out of the L & M program and redirected to Backus if this application is approved.

The risk is due to the overlapping service areas, combined with steerage leverage exerted at Backus, as they are part of the health care, Hartford HealthCare system.

The comment earlier, that patients are already deciding, is a misleading comment. These are patients suffering from a heart attack, and, in most cases, the physician is making that call.

And as we already talked about earlier, the most efficient care for those patients would be to direct them to the nearest established program.

At the low end of the range, from my estimates, L & M's incremental losses would be expected to be in excess of a million dollars, given the significant fixed cost nature of this program and investments already made by L & M.

While this negative financial impact will be felt acutely at L & M, it is not limited to our hospital. There will be negative implications to other programs, as well, and, indeed, the financial strength of Connecticut's health care system.

Connecticut hospitals, as you know, are facing tremendous financial challenges, which is leading to the consolidation and, in some places, reduction of programs in existence today, even essential services (coughing).

It is imperative that hospitals carefully plan strategic investments. In this case, Backus has proposed a very costly solution to an unneeded health care service. Rather than creating duplicative services, Backus, as a sponsoring hospital, could opt for a simple solution in leveraging existing technology already available and deployed throughout the EMS system to more quickly and effectively identify and route patients directly to the most appropriate center.

As evidenced in earlier commentary, cases from the L & M catchment area today that should already be serviced by L & M are being subverted and transferred to Hartford Hospital.

Despite being nearly double the transit time, Backus patients are being transferred there, due in part because of their alignment with Hartford Hospital.

If approved, primary PCI or elective PCI services at Backus will adversely impact health care cost, quality and sustainability.

As my colleagues have addressed, the addition of duplicative and costly primary or elective angioplasty services at Backus Hospital is not carefully planned, as Backus has also not demonstrated a public need or adequately identified the service area.

As it is unlikely that Backus will reach these projected utilization figures without significant financial strain to L & M's program, Backus is doing a disservice to the residents of the state by directing scarce resources to a program that will offer more harm than benefit, while weakening the existing quality and patient care of a previously-established and approved program in existence.

Based on a clear showing of the unprofitability, as offered in their own exhibit, which appears to be very aggressive in its assumptions, with an added FTE estimated at only two, for an example, and the negative financial implications to L & M, other angioplasty programs in the state as a whole, it's very questionable why Backus is actually seeking this approval.

I'm confident that OHCA will consider the lack of financial viability in this proposal and deny both the primary and the elective angioplasty requests.

And I, too, would be happy to answer any questions. Thank you so much for your time and consideration.

HEARING OFFICER HANSTED: Thank you.

MS. VOLPE: That concludes our presentation as an Intervenor.

HEARING OFFICER HANSTED: Okay, thank you. Thank you, both counsel. I just want to make a quick clarification to the record.

In the beginning, I said that the Applicant, William Backus Hospital, has been designated as a party. In addition to William Backus Hospital, Hartford Hospital has also been designated as a party.

And now what I'd like to do, as I stated in the beginning, is turn to any public commenters we have here today, or public officials. Do we have anyone still in the room? Okay, we have a couple of folks.

Ladies before gentlemen. Thank you.

MS. DEB HINCHEY: Thank you. Thank you, all, for allowing me this time. My name is Deberey Hinchey. I am currently the Mayor in the City of Norwich, and I come before you to speak in favor of allowing this process to go forward at Backus Hospital.

I am the Mayor of a City, who struggles.

There are 40,000 people in the city, and Backus Hospital is our community hospital. For many years, Backus was a standalone before they became associated with Hartford Hospital, and there is great sentiment among the people, who live in Norwich, for this hospital and the health care that they have provided the citizens that live in the area.

I am not a health care expert, however, I, for the past 30 years, prior to being elected Mayor, I am a clinical social worker, who did home care, and I know the repercussions of family members having to go farther away to get their health care. It's very difficult.

At the end of my career, I worked as a Hospice social worker, and it was very difficult for patients' families, who are critically ill, to have to travel.

Transportation in our area is difficult as it is, and, so, having the availability of this, being able to have this procedure right there within the City limits is invaluable to the individuals, who would use it.

I'd also like to say that, as the Mayor of the City, as I said, it struggles, both economically, job-wise. We work hard to bring better health care to

the City, to provide programs that help people to live healthier lives. I've spent a lot of my working career helping people do that, and I believe that Backus Hospital and this service would aid in providing a healthier community.

I applaud Backus Hospital for trying to provide this for the citizens that I care so deeply about and who have such need, and, so, I would ask you to please consider on the positive note this application.

HEARING OFFICER HANSTED: Okay, thank you.

MS. HINCHEY: Thank you very much for your time.

HEARING OFFICER HANSTED: You're welcome. Good morning.

MR. PAUL SWEET: Good morning. My name is Paul Sweet. I'm currently First Selectman of the Town of Plainfield and have been for 22 years.

I've been in public life for over 40 years, and one thing that I, first of all, want to say that I support the application by Backus.

Secondly, I'd like to appeal to this panel on a different level, representing people, representing the men and women of not only my community, but northeastern Connecticut.

Plainfield was a major benefactor of the Backus emergency room being placed in our community, and, from that time, we've seen nothing but growth and good will continue.

The people of our community in this program, certainly, when you talk about people, we're talking about thousands of people. We're talking about Backus Hospital being a hospital that is used by many folks up where I come from.

The common sense would tell us, with a population like we have, that this program is needed, and, quite frankly, Backus, being part of the Hartford network, certainly provides all kinds of services to us now.

It makes sense that this type of program be approved for this site, simply because, up in the northeast, we travel quite a ways to have tests done.

When you talk about heart procedures in Plainfield or the surrounding community, what comes to mind is Hartford Hospital, people go to Hartford Hospital, or, if you're in the far north, you may go to Massachusetts to UMass, but that being the case, there's a great population.

We live in a very rural part of the state,

and you go 395, yes, you can get off in Plainfield, but Plainfield, once you leave the center, it becomes very rural, and it continues to be rural into Canterbury, Sterling, Voluntown, Killingly.

It's not easy for our people just to get anywhere to have a procedure done. On a nice day, you certainly can travel and take in a day, but a lot of times it just seems to be fate that, when you've got to go have a test done and you've got to drive to Hartford, it's either raining, or it's snowing, or there's some type of traffic, construction, and you're backed up for miles.

Just coming up here this morning, I was trying to see what it was like to drive from Plainfield to here and make sense of the ride, until we saw that Downtown exit was closed, and now the Garmin on the dashboard is recalculating where we are.

Now that's a funny story, because, trust me, we saw quite a bit of Hartford this morning trying to find this place, but that's a real reality with folks that have people that get transferred up to Hartford Hospital. Whether it's hot, whether it's rain, whatever it may be, we've got folks that aren't familiar with this neck of the woods.

Backus Hospital is clearly the hospital of many people in our neck of the woods, and, again, I just want to appeal, as someone that's been on the ground for over 40 years in public life, appeal to the panel that our folks need this program. This is a needed program for us.

I'm not picking and choosing. I'm not a hospital professional, like folks in this room today, but I'm just telling you the truth of the fact, that this procedure being done in Norwich is going to be a big deal for us folks up in the northeast, so I'll leave it at that.

It's been a long morning, but I would hope and urge you to approve the application, based on the needs of the people from our area of the state. Thank you.

HEARING OFFICER HANSTED: Thank you. Is there anyone else in here that wishes to give public comment? No, I don't see anyone, so, at this point, we'll take a break. I guess we might as well make this our lunch break. It's 11:35. If everyone could be back here by let's say 12:45, we'll hear argument on the motion and the objection.

And for those folks that aren't involved

in that argument, you know, feel free to take a longer lunch. Just check back in for the remainder of the proceeding here today, so, at this point, we'll break until 12:45. Thank you.

(Lunch recess)

HEARING OFFICER HANSTED: Okay. We are back on the record. We are going to hear argument from the Applicant on their motion in limine, dated March 22, 2016, and argument by Lawrence & Memorial Hospital and their objection to the motion in limine, which is dated March 23, 2016.

Just before we begin, I mean, obviously, we're getting later in the day, we have to adjourn this hearing at 3:00 p.m., so there's a probably good probability that we won't finish today, so I'll talk to counsel after the hearing today, and we'll discuss some further dates.

Okay. Counsel, did you want to begin?

MR. COHEN: Sure. Thank you.

HEARING OFFICER HANSTED: You're welcome.

MR. COHEN: As you mentioned, we filed a motion in limine to preclude L & M's pre-filed testimony related to out-of-state providers. They, in their pre-filed testimony, indicated that there are out-of-state

providers to service the needs of this community.

In short, we believe that, under the OHCA rulings, that OHCA is allowed to exclude volume data from out-of-state patients that are treated at Connecticut health care facilities in its evaluation of a Certificate of Need.

Now we haven't said that you can't consider those. In fact, you have considered them in the cases that were cited by L & M, indicate that, in at least one situation, you have. It was Greenwich Hospital.

Their service area included 11 out-of-state cities and towns, and the closest provider was 11 miles. I'm sorry, 18 New York State cities and towns, and the closest provider near Greenwich was Westchester Medical Center, which was, I believe, 11 miles away.

We don't have those situations here. The situation here is extremely different. We're not talking about something that's 11 miles from our hospital.

These facilities that are out-of-state are not subject to OHCA approval, not subject to your oversight, not subject to reporting obligations, not subject to OHCA's quality control measures.

They can shutdown without OHCA having any

involvement at all in that. There's no role for OHCA to play in the need for the facilities. You don't have your typical rigorous oversight and reporting obligations that you have with the Connecticut facilities.

Moreover, as we've discussed here today and will discuss, I'm sure, in the response to the Cross-Examination questions, there's a continuity of care.

You have an out-of-state provider, could be different EMR, different insurance requirements. Our practitioners have found that, when their patients go out-of-state, that there are significant, potentially significant insurance issues that may apply.

The patients could face long delays in health care costs, or, in some instances, may not be able to use health care at all. As I mentioned, there's an EMR issue.

So, for all of those reasons, we believe that, in this particular application, with the hospitals as distant as they are from Backus Hospital, it's wholly inappropriate to consider the availability of out-of-state medical centers, out-of-state PCI centers to provide these services for our Connecticut residents.

More appropriately, it would be to allow Backus to provide these services to the residents in its

angioplasty region.

So, for those reasons, we believe that all of the discussion and evidence related to out-of-state providers should be stricken from their pre-filed testimony, and they should not be allowed to testify regarding those matters.

HEARING OFFICER HANSTED: Thank you, counsel. Attorney Volpe?

MS. VOLPE: We speak in opposition of the motion, and we believe the motion should be denied for a variety of reasons.

One is, the Declaratory Ruling that Applicant's counsel would have you rely on doesn't speak of out-of-state providers. It talks about out-of-state patients.

This is an entirely different set of facts and scenario here. We're dealing with access to care for a region, for a population, for an in-state population having access to care, so the ruling that they would like you to rely on deals with patient volume, not provider, out-of-state providers.

In addition, by their own admission in their application, they have used UMass data, and this office has asked for questions, and completeness

questions, and issues with UMass data, and I quote from 459 of their own application. It says, “To complete a PCI volume and market share analysis in the service area, 3d collected Massachusetts inpatient data for fiscal year 2012 and extrapolated volumes.”

So, I mean, they can’t have it both ways. They can’t ask us to not be able to speak to their application when they’ve, in fact, used UMass numbers and statistics.

In addition, OHCA has great discretion, as to what it can and cannot look at. There’s nothing in the statutes, in the regulations, in your own policies that prohibits you from looking at out-of-state providers and whether or not Connecticut patients have access to needed services from an out-of-state provider.

As important, at least four of the towns in their angio region are closer to UMass, significantly closer, so, from our perspective, it is important to take that into account, because you have to look -- when the national guidelines for SCAI, you know, AHA, when they ask you to look at those, they don’t say put blinders on.

If a provider is within a 30-minute drive time, if you have to cross the state border, so be it. It’s, again, it’s access to care, immediate access to

care and need.

So we would argue that OHCA has discretion to look at out-of-state providers, factor it into a needs analysis, determine whether it impacts access for Connecticut patients.

So, I mean, our arguments are outlined in detail in our motion before you. We realize you haven't had a lot of time with it. We didn't have a lot of time with it either. We got it last night.

From our perspective, I think it would be egregious not to allow a discussion of out-of-state providers in this proceeding. It's already been in the docket from day one.

Our position is that their motion should be denied. Thank you.

HEARING OFFICER HANSTED: Thank you. Counsel, do you have any follow-up?

MR. COHEN: Yeah. On the use of Mass data, that's kind of ironic. All we were doing with that was to determine by zip code where the patients from UMass came from, and what we found was that there was a percentage of patients that were serviced at UMass that came from our service area, and that went into our calculations.

In addition, the UMass facility is not significantly closer. It's about the same distance for much of that area as Backus Hospital is.

And then, finally, we know that the case that we cite doesn't look at out-of-state providers. It looks at out-of-state patients, and it looks at whether OHCA can consider a determination of need out-of-state patients in calculating whether there's a need.

What we're talking about is, by analogy, making the same kinds of arguments with regard to out-of-state providers, saying that the out-of-state providers shouldn't be allowed to be used in addressing needs of in-state Connecticut patients, so thank you.

HEARING OFFICER HANSTED: You're welcome. So if I preclude the out-of-state information from the Intervenor, do I preclude the out-of-state information in your application?

MR. COHEN: Well the out-of-state, again, the out-of-state information in our application is only related to patients in Connecticut that are serviced out-of state. That's what we're trying to demonstrate, that there is a need that some of these patients are going out-of-state, because Backus doesn't have a program.

MS. VOLPE: And if I may?

HEARING OFFICER HANSTED: Sure.

MS. VOLPE: Some of these patients are going out-of-state, because it's significantly closer to go to UMass. I mean they say not, but, I mean, we can look it up, but, you know, if you're looking at Thompson, it may be 35 miles from there to Backus, but it's 24 to UMass.

I mean could we be off a few miles here or there and based on our source? You're not going to be off 11 miles. I'm sorry. Minutes. Again, it's minutes.

We might be off a few minutes, but you're not going to be off substantially that amount of minutes. That's true of Thompson, Woodstock, Putnam and Pomfret.

I mean they're minutes, several minutes apart, some as many as 11 minutes, so it is significant, and I think it should be accounted for.

And, again, when OHCA is doing its analysis, if it's using its own reports and data and surveys and I know you don't recognize precedent, but precedent with other providers, when you're doing your own analysis for this particular service, okay, you have to take into account the closest proximity provider, who is capable of delivering PCI services.

That's what the national guidelines, which

we've all been throwing around, state, as well as your own, so I think it's not prudent or reasonable to suggest that we not factor in an out-of-state provider, who happens to be considerably closer in drive time.

HEARING OFFICER HANSTED: All right, thank you, counsel. I'm going to reserve judgment on the motion in limine. I will issue a written ruling within a week, by next Friday, which I believe is April 1st, if I'm correct.

MR. COHEN: April Fool's Day.

HEARING OFFICER HANSTED: Okay. I'll make it the day before. April 1st, I'll issue a decision by that date, but, for purposes of today's hearing, I want to hear that information, and, if I decide to rule in favor of the motion in limine, then we can exclude that information subsequent to the hearing.

Counsel, if you want to begin with Cross-Examination, or if you have any further Direct of your witnesses, or did you want Attorney Volpe to --

MR. COHEN: I thought we had said that Attorney Volpe was going to Cross-Examine our witnesses first.

HEARING OFFICER HANSTED: That's fine. Did you have any more Direct?

MR. COHEN: I may after Attorney Volpe Cross-Examines our witnesses.

HEARING OFFICER HANSTED: Okay,

MR. COHEN: But, at this point, I do not.

HEARING OFFICER HANSTED: Okay. All right. Attorney Volpe, do you want to proceed?

MS. VOLPE: Okay, so, just in the interest of having all of the questions answered, I think there was some discussion, as to we would possibly propose a question, and they would determine on their team who is best suited to answer it. Is that a reasonable protocol that we're going to implement in the questioning?

MR. COHEN: Yes.

HEARING OFFICER HANSTED: That's fine with me, Attorney Volpe, as long as we can keep it somewhat organized.

MS. VOLPE: Sure.

HEARING OFFICER HANSTED: The other alternative is if you just want to call up his witnesses one-by-one and do all your questioning of that witness.

MS. VOLPE: Yeah. I think we may call them up, just for ease of the room setup. It might be easier if we have them come up, because, you know, everyone is sort of scattered in the room.

HEARING OFFICER HANSTED: Absolutely.

MS. VOLPE: If that would be okay.

HEARING OFFICER HANSTED: Whoever is testifying I want to sit up front here in front of the microphone.

MS. VOLPE: Okay.

HEARING OFFICER HANSTED: But I'll leave it up to counsel who they want to answer the question.

MR. COHEN: Thank you.

MS. VOLPE: Okay, so, if he would, we would like to have Mr. Foreman from 3d come on up and answer some questions for us.

HEARING OFFICER HANSTED: And, just remember, you're all still under oath.

MS. VOLPE: Hi, Mr. Foreman.

MR. FOREMAN: Hi.

MS. VOLPE: Was it you or your company that conducted the market analysis for William Backus Hospital?

MR. FOREMAN: Both.

MS. VOLPE: You and your company?

MR. FOREMAN: Correct.

MS. VOLPE: Okay and --

HEARING OFFICER HANSTED: Can you hear

okay?

COURT REPORTER: You have to repeat that, because you need to have the microphone on.

MR. FOREMAN: Yup. Sorry.

MS. VOLPE: Okay, thank you. And please ask me to repeat something if it’s not clear, or if you can’t hear me.

So have you or your company ever done a PCI services market analysis for a hospital?

MR. FOREMAN: We have.

MS. VOLPE: Specific to PCI services?

MR. FOREMAN: We have.

MS. VOLPE: And who have you done that for?

MR. FOREMAN: We’ve probably done a bunch of them across the country, so, off the top of my head, I don’t remember.

MS. VOLPE: Have you done any in Connecticut?

MR. FOREMAN: No.

MS. VOLPE: Okay. Have you done any in Massachusetts?

MR. FOREMAN: I don’t remember.

MS. VOLPE: Okay.

COURT REPORTER: Make sure you keep your voice up.

MR. FOREMAN: Okay. Sorry.

MS. VOLPE: So, based on the detailed analysis you conducted for Backus, were you asked by representatives of Backus to do that analysis or Hartford Hospital? Do you recall who retained you?

MR. FOREMAN: I think my consulting agreement was with Backus.

MS. VOLPE: Okay and when you did the analysis, did your findings -- what did your findings show for national PCI trends? What did they determine for national PCI trends?

MR. FOREMAN: We focused, actually, on the local market.

MS. VOLPE: So did you look at national trends for this service?

MR. FOREMAN: We compared the local market to national benchmarks.

MS. VOLPE: And did you recall what the trend showed for a national PCI volume?

MR. FOREMAN: For PCI volume?

MS. VOLPE: Correct.

MR. FOREMAN: We looked at incidence of

the disease and the incidence of treatment at a national level and then compared that to the local reality within the defined geography.

MS. VOLPE: Okay, but, for purposes of a national trend, if you will, in PCI, do you know is it going up, down, staying the same? Do you recall?

MR. FOREMAN: It was irrelevant for our study, because we were focusing on what was happening within this geography.

MS. VOLPE: Okay, so, based on the analysis you conducted, did you look at ChimeData for specific Connecticut trends?

MR. FOREMAN: We did.

MS. VOLPE: And what did your analysis show, since you said you focused primarily on the local Connecticut? What did your analysis show for the state of Connecticut's trend in PCI?

MR. FOREMAN: PCI incidence?

MS. VOLPE: Volume.

MR. FOREMAN: PCI volume. That over the last '09 to '15, inpatient volumes have basically been flat sometimes, and I looked at it within this region, but sometimes it would pop up a little bit. Other times, down a little bit, but basically flat. The big

transition --

MS. VOLPE: Oh, that's okay. You answered my question. It was flat. That was my question.

MR. FOREMAN: Okay.

MS. VOLPE: How many or what is the number of the cities and towns in the angioplasty region you defined? How many are there? Do you recall?

MR. FOREMAN: I don't recall. I can look for you.

MS. VOLPE: Sure. Why don't we look?

MR. FOREMAN: And all of our analysis was done at a zip code level, not a Town level.

MS. VOLPE: But all of the data and charts from OHCA and you weren't presented at the Town level, so --

MR. FOREMAN: Depending on what you're talking about. It looks like 26 towns.

MS. VOLPE: Okay and, just for the record, can you, for the record, let us know what page you're or what reference you're looking at to come up with that number 26?

MR. FOREMAN: Yeah. I'm looking at my own market assessment in my notes.

MS. VOLPE: Okay, so, that's the number

that we came up with, too, so 26. And when you did your market analysis, in terms of what did you use to determine the drive time in minutes from those zip codes or towns, if you will, to Backus Hospital? What was your source?

MR. FOREMAN: A software company, called Maptitude.

MS. VOLPE: Okay and do you know what the national standards state is the appropriate drive time in minutes for a patient to have access to these services, these PCI services?

MR. FOREMAN: Which PCI services?

MS. VOLPE: Let’s just use primary, which is emergent.

MR. FOREMAN: Right.

MS. VOLPE: Do you know what the national standards for, say, SCAI, or AHA, or ACC?

MR. FOREMAN: I do, but I think we have people that probably have a lot more experience with that than I, so I’m probably not going to weigh in on the standards.

MS. VOLPE: Okay, but you did the drive in minutes, and that’s important for purposes of -- you determined the region for them. You determined the

service area, correct?

MR. FOREMAN: Correct.

MS. VOLPE: Right and, in doing that, determining the service area, which you say is the backbone of the application, we agree, and the service area is ultimately what OHCA is looking at in access.

Let me ask you a different question. When you do a market analysis for a health provider, do you always do it based on a specific service, as opposed to a region recognized by CMS or local Department of Public Health designated areas? Do you always make it service-specific?

MR. FOREMAN: I always make it specific to the analysis, so if I were doing a net income guarantee for an independent physician, I would use the CMS service area, 75 percent service area.

If I were looking at adding beds to a hospital, I would use the general service area, but I do make it specific, based on the circumstance.

It’s basically are you starting a Cabela’s, or are you starting a Subway? People travel two hours for a Cabela’s, but they won’t travel 10 minutes for a Subway.

MS. VOLPE: Right, but do you exclude

national criteria? Since you're saying you do it service-specific, wouldn't you look at what the national quality criteria guidelines are for a drive time in minutes in establishing a service-specific region?

MR. FOREMAN: Yeah. I said I made it circumstance-specific, and here what we were using is drive time as one of the key factors, along with all the other factors that I mentioned this morning, including it's not a service currently offered at Backus, so, looking at their historic patient origin data and relying on that doesn't make sense, travel time, as I mentioned.

It doesn't include outpatient data, so that that transition that I mentioned in volume from inpatient to outpatient is not considered, the role of EMS, and then just looking at the closest zip codes for primary service area or for primary services, rather.

MS. VOLPE: Okay, so, let me ask you another question, then. Do you know, since you did the analysis and you did it through the Maptitude, do you know how many towns in the angioplasty region that you created for them have a PCI-capable provider within a 30-minute drive time? Do you know how many towns in your region?

MR. FOREMAN: Yes.

MS. VOLPE: How many?

MR. FOREMAN: So the way that we did it was to look at this was a prospective analysis to determine --

MS. VOLPE: I don't want to cut you off, Mr. Foreman, but Mr. Hansted --

HEARING OFFICER HANSTED: I heard the question was how many providers are in that area?

MS. VOLPE: How many?

MR. COHEN: Well I'm going to ask for clarification. Do you mean from the edge of the town? Do mean from the center of town? Do you mean from the farthest side of the town?

MS. VOLPE: Sure. Use the center. I'm talking about whatever Maptitude analysis resource he used.

MR. COHEN: Well that's what he was starting to explain when you cut him off. He was going into exactly that issue, so, if he could continue, that would be great.

HEARING OFFICER HANSTED: I'll let him continue, just to get some background on how he came up with the number.

MR. FOREMAN: So we looked at -- the

regions are driven, as I mentioned this morning, off of zip code-by-zip code what the closest PCI provider would be if Backus Hospital was a PCI provider, so, given that, it's 20 within the 30 minutes of Backus Hospital.

HEARING OFFICER HANSTED: And that's for both elective and primary?

MR. FOREMAN: Correct.

MS. VOLPE: Well I think you've answered a question I didn't ask. I think you're saying that, for 20 of the towns in the region, Backus would be within a 30-minute drive. That's not my question.

My question is how many towns in the angioplasty region have access to another capable PCI provider than Backus within a 30-minute drive?

MR. FOREMAN: So those towns that I just mentioned, Backus is the closest.

MS. VOLPE: But that's not my question.

MR. COHEN: If you'd let him finish.

HEARING OFFICER HANSTED: Her question is, if Backus did not have the program, those towns, what would be the closest providers of this service? Is that accurate, Attorney Volpe?

MS. VOLPE: Actually, thank you. What I'm asking is how many of those towns, based on your

Maptitude, have a PCI-capable provider within a 30-minute drive time? I mean if you don't have that answer --

HEARING OFFICER HANSTED: Did you want to have another individual answer the question?

MS. VOLPE: Does anyone know that answer?

MR. COHEN: Well the analysis was not, as Mr. Foreman indicated, he looked at zip code-by-zip code, so the question is town-by-town, as I understand it.

I don't know if you can answer town-by-town how many towns are within the 30-minute drive time of L & M.

HEARING OFFICER HANSTED: No, no, that's not the question.

MS. VOLPE: No, that's not the question.

HEARING OFFICER HANSTED: Do you want to repeat your question again?

MS. VOLPE: Sure, I will, and, again, we want to get to the answer, so any way we can get to the answer let's do it.

We said there's 26 towns. If those towns have multiple zip codes, you would be able to tell us that, Mr. Foreman. I'd be surprised if these rural towns had multiple zip codes, like they do down in Greenwich, but if there are multiple zip codes and there are more

than -- how many zip codes did you find in your angioplasty region? Let me start with that.

MR. FOREMAN: I don't know, because we did roll -- so we did all the analysis at a zip code level and then rolled it up into towns for purposes of --

MS. VOLPE: Well which is it, though?

HEARING OFFICER HANSTED: She wants to know the amount of zip codes in your analysis.

MR. FOREMAN: The number of zip codes? I don't know if I have it.

MS. VOLPE: Okay, so --

MR. COHEN: We can do a late file on that, if you'd like.

HEARING OFFICER HANSTED: Do you want it?

MS. VOLPE: I think we have it in our application, I mean in our Intervenor. We've shown how many existing providers there are within a 30-minute drive time required of the national criteria. We have it, and we have it on page, you know, 22 of our pre-filed testimony on 35 stamped, so it's in the record.

What I wanted to know, since you developed this region and it is the backbone of the CON analysis and this Department is charged with applying criteria to this service for the purposes of determining access for

Connecticut residents, I think it's important to know whether these patients have access within the national and Connecticut guidelines. That's what we're trying to get an answer to, Hearing Officer Hansted.

HEARING OFFICER HANSTED: So you testified that you don't know right now the zip codes, the number of zip codes?

MR. FOREMAN: Correct.

HEARING OFFICER HANSTED: Is that in your report somewhere?

MR. FOREMAN: I mean it's in my work product, yeah.

HEARING OFFICER HANSTED: Okay.

MR. FOREMAN: So, I mean, I can easily get that.

HEARING OFFICER HANSTED: I'll order that as Late File No. 1.

MS. VOLPE: And, so, again, I was saying that to try to accommodate getting a response. If there's going to be a late file specific to that issue, we'd also ask that it be done by town, which is in accordance with the charts that OHCA has requested that the Applicant has provided the data.

MR. COHEN: So if I can get some clarity,

are you talking about the center of town, the edge of town?

MS. VOLPE: Sure. The center of town. Sure.

HEARING OFFICER HANSTED: We can go by the center of town.

MR. COHEN: Okay and that's Late File 2?

HEARING OFFICER HANSTED: Late File No. 1.

MS. VOLPE: Well I think it's one late file, but the information is going to be presented in zip code and town.

HEARING OFFICER HANSTED: Two separate sections.

MS. VOLPE: By zip code and town.

MR. COHEN: Okay.

MS. VOLPE: From your developed angioplasty region.

Okay, so, a lot of my questions deal with this specific issue, as they relate to Mr. Foreman. I will ask him a couple of other questions. Please feel comfortable to defer.

One is are you familiar with the 90-minute door-to-balloon time that you cite in the 3d analysis?

MR. FOREMAN: I am.

MS. VOLPE: Okay and do you know what facilities this 90-minute time period applies to?

MR. FOREMAN: I do.

MS. VOLPE: And what does it apply to?

MR. FOREMAN: Facilities with PCI.

MS. VOLPE: Correct, so, do you know what the minute time period is for facilities like Backus without PCI?

MR. FOREMAN: I do.

MS. VOLPE: And what is that?

MR. FOREMAN: One hundred and 20 minutes.

MS. VOLPE: Okay and I'm going to ask a similar question that I asked for the towns. Do you know how many towns are within the 125-minute drive time?

MR. COHEN: One twenty-five?

MS. VOLPE: I'm sorry, 120.

MR. FOREMAN: That's not how we did our analysis.

MS. VOLPE: Okay, so, are you aware that for patients presenting at Backus -- you said the national quality standard is the 120. Why did you exclude access to closer out-of-state hospitals in your drive time analysis? Why did you choose to do that?

MR. FOREMAN: Honestly, because I'm coming

to a State agency. I thought the solution of pushing patients out of the state would honestly be out of the question as a reasonable solution for those residents, so I didn't even consider it.

MS. VOLPE: We wouldn't characterize it as pushing. I understand you have, but it's in access. The State is concerned with access.

So another question. When you were retained, what is the hospital in the middle of this angio region? Do you know what hospital already exists in the middle of that region?

MR. FOREMAN: In the middle of?

MS. VOLPE: Of your angio. Right smack dab in the middle of that angioplasty region, what hospital is currently located there?

MR. FOREMAN: Backus?

MS. VOLPE: No.

MR. FOREMAN: The region that I define?

MS. VOLPE: Yeah. There's another hospital in that county. Windham. Windham Hospital. Are you familiar with Windham?

MR. FOREMAN: Oh, yes.

MS. VOLPE: Okay. Did you look at whether or not Windham is closer for the patients in this angio

region to receive PCI services?

MR. FOREMAN: As opposed to?

MS. VOLPE: Backus.

MR. FOREMAN: No.

MS. VOLPE: Okay, so, do you know, as the consultant for Backus, which is affiliated with the Hartford health system, did they ever consider Windham for services?

MR. FOREMAN: I don't know.

MS. VOLPE: Can anyone answer that question?

HEARING OFFICER HANSTED: Wait, wait. Excuse me. If you're going to testify, I need you up here in front at the microphone.

MR. COHEN: Can I move this closer?

HEARING OFFICER HANSTED: Sure. Court reporter, will that pick up? Okay.

DR. FOLEY: I'll try to speak louder. In answer to your question, it's a good question.

HEARING OFFICER HANSTED: Just identify yourself.

DR. FOLEY: Oh, I'm sorry. John Foley, Dr. Foley from the East Region Cardiology.

HEARING OFFICER HANSTED: Thank you.

DR. FOLEY: So it's a good question geographically, but the hospital, itself, is very small, essentially 20 to 25-bed hospital, with no cath facilities, and, you know, pared down operations in terms of what we offer cardiovascular-wise.

MS. VOLPE: So there's no diagnostic?

DR. FOLEY: It would be a strategic and operation of a possibility to really develop a program like this at Windham. You just have the see the facility and know the community.

MS. VOLPE: Okay.

MR. COHEN: While we're waiting, there is a -- we don't need the late file. It's, in completeness questions, I think it's 1455, is the analysis by zip code. Yeah. Our completeness questions that we filed on December 30th. As I said, 1455, 1456, 57 and 58, so it goes into great detail by zip code.

MS. VOLPE: But it doesn't --

HEARING OFFICER HANSTED: Hold on, Attorney Volpe, one minute.

MS. VOLPE: Yeah, sure.

HEARING OFFICER HANSTED: Okay, Attorney Volpe?

MS. VOLPE: Yes, thank you. It's not

responsive to the question we've presented. What this data shows on page 1455 is whether Backus is within a 30-minute drive time to these towns and the zip code on the left.

The question that we've presented is, of your angio region, either your zip codes or your towns, how many other capable PCI providers currently exist in the region within this 30-minute standard?

MR. COHEN: This addresses that. It indicates where L & M is the closer provider.

MS. VOLPE: Not for all of them.

MR. COHEN: Well I think you have to ask the witness those questions.

MS. VOLPE: Well I did, and he didn't know it.

HEARING OFFICER HANSTED: Wait. Wait. Counsel, one at a time. She did ask the witness the question. I agree that this does not answer the question directly. It may for L & M, specifically, but I'd still like to see the late file, as ordered, which is, you know, within the identified region, how many existing PCI providers are available within a 30-minute drive?

MR. COHEN: L & M would be the only one that would be available.

MS. VOLPE: That's inaccurate.

HEARING OFFICER HANSTED: Well if that's what they want to testify, then that's their testimony. So it's your testimony that, within that 30-minute drive, L & M is the only PCI provider?

MR. FOREMAN: I don't think I'm -- could we ask the question to be repeated?

HEARING OFFICER HANSTED: Yeah. Why don't you repeat the question again?

MS. VOLPE: Okay. My question is Backus is not an approved PCI provider, so with the region you've defined, the angioplasty region, how many other PCI providers exist for this population within a 30-minute drive time?

MR. FOREMAN: Yeah, so, I'm going to have to get that, because our whole analysis was based on the framework of Backus obviously applying for these services.

HEARING OFFICER HANSTED: Right.

MR. COHEN: We have that information.

MS. JANETTE EDWARDS: It was included in your pre-filed testimony, or, to my estimation, as I look through your list, L & M is not the closest provider to these geographies, however, there are four out-of-state

providers that are at some times within a 30-minute drive time.

According to your list, Thompson, Connecticut is closer to UMass Memorial, a 24-minute drive time. Again, according to your analysis.

Again, just scanning through the list, I believe Putnam, Connecticut is within a 26-minute drive time to UMass Memorial, and I don't believe I see anybody else with under a 30-minute drive time that would serve this population.

MS. VOLPE: Colchester, St. Francis and Hartford Hospital are within 30 minutes.

MS. EDWARDS: Thank you.

MS. VOLPE: Columbia, St. Francis is, also. Hebron, St. Francis is within a 25-minute drive time. There are lots of towns within this region.

HEARING OFFICER HANSTED: Well, Attorney Volpe, I don't want you to testify. We understand the question. Do you feel her answer at this point has answered your question?

MS. VOLPE: Well it's really whether or not there's enough information in the record to establish how many PCI providers are within a 30-minute drive to this region. I think that is the access issue, and we

want to make sure that there's enough information in the record for that to be known, based on these 26 towns that Mr. Foreman has said make up their angio region. We want to make sure we're all working off the same data points.

MR. COHEN: Mr. Hansted, we'll file a late file by zip code, so that we can resolve --

MS. VOLPE: And town.

HEARING OFFICER HANSTED: And town.

MR. COHEN: By zip code and town, so that we can resolve this issue.

HEARING OFFICER HANSTED: Thank you.

MS. VOLPE: Based on the center.

HEARING OFFICER HANSTED: And if it's duplicative information, that's fine. We'll accept it as a late file.

MR. COHEN: With regard to town, we'll pick the center of the town.

HEARING OFFICER HANSTED: The center of town.

MR. COHEN: I don't know, Shane, how you deal with zip code. Does the map have the center of the zip code?

MR. FOREMAN: We can do it that way.

HEARING OFFICER HANSTED: Do it by center

of town.

MR. FOREMAN: I can simplify it.

HEARING OFFICER HANSTED: Okay, thank you.

MS. VOLPE: Okay. Thank you, Mr. Foreman. I think --

MR. FOREMAN: Thank you.

HEARING OFFICER HANSTED: Thank you.

MS. VOLPE: Thank you.

HEARING OFFICER HANSTED: Counsel, do you have any Redirect?

MR. COHEN: I thought we were going to wait until the end, but I do have --

HEARING OFFICER HANSTED: No, she's done with her Cross. I'll allow you to Redirect.

MS. VOLPE: With Mr. Foreman I am, yes.

HEARING OFFICER HANSTED: With Mr. Foreman.

MR. COHEN: Okay, sure. I do have a couple of Redirect. The first is you started to say the data is flat with regard to PCIs, and then you said the big transition, and Attorney Volpe cut you off and said you answered the question. Can you continue to answer the question, please?

MR. FOREMAN: Sure. So what I've seen

thus far when the Intervenors have talked about volume within this market, they're ignoring outpatient, and, so, they're looking at inpatient only and looking at the trends within inpatient only, and depending on which inpatient case we're talking about, some are up, some are down. By and large, they're flat year-over-year, but the big transition starting October 1st of 2013 was the two-midnight rule, which basically took a lot of elective inpatient cases and made them outpatient cases.

So the notion, that volume within this defined geography is dramatically going down, is absolutely not true if you count outpatient cases.

MS. VOLPE: Okay. If --

MR. COHEN: Thank you. And, to continue --

MS. VOLPE: Well just while we're on that question --

HEARING OFFICER HANSTED: No. Just allow him to finish.

MS. VOLPE: Okay.

MR. COHEN: To continue, if you can look at page six of your report, which is page 453 of the filing with OHCA, there was a question regarding what are the 26 towns. Does this describe the towns?

MR. FOREMAN: Correct.

MR. COHEN: Okay, thank you. That was unclear. One of the issues that was raised in the testimony that we heard this morning was the impact on L & M with the granting of a program at Backus Hospital.

Can you please comment on what you heard this morning, which was that 25 --

MS. VOLPE: Well I would object. That's not appropriate.

HEARING OFFICER HANSTED: No, no. Wait, wait, wait. No. This is Redirect. If he talked about it on Cross, I'll allow it. If he did not, I'm not allowing it.

MS. VOLPE: It did not come up in my questioning. The Hearing Officer gave you an opportunity to offer additional presentation.

HEARING OFFICER HANSTED: So I won't allow that on Redirect.

MR. COHEN: Nothing further.

HEARING OFFICER HANSTED: Nothing further? Okay. Counsel, you had one follow-up question?

MS. VOLPE: I did, based on his response, specific to the response. Mr. Foreman, you were relying on outpatient saying that those numbers weren't taking

into account. Do you know if a STEMI patient is that considered an emergent inpatient or outpatient? Do you know?

MR. FOREMAN: Obviously, the elective is the only category with the outpatient.

MS. VOLPE: Okay, so, STEMI, you would agree, is an emergent, is all inpatient data?

MR. FOREMAN: Correct.

MS. VOLPE: Okay. We don't have any further questions.

HEARING OFFICER HANSTED: Okay, thank you.

MS. VOLPE: Thank you.

HEARING OFFICER HANSTED: Thank you.

MS. VOLPE: We have some questions for Dr. Kiernan.

HEARING OFFICER HANSTED: Okay. Dr. Kiernan?

MS. VOLPE: Hi, Dr. Kiernan.

DR. KIERNAN: Hello.

MS. VOLPE: I realize you didn't offer testimony today, and, so, this is really based on your pre-file. If you're more comfortable deferring to Dr. Thompson, that's appropriate, as well, because I know he did offer testimony today, so we'll just leave it up you

what your preference is, okay?

DR. KIERNAN: Certainly.

MS. VOLPE: So will you be the one overseeing the services if they were to be implemented at Backus Hospital for emergent PCI?

DR. KIERNAN: That's likely to be the case, although we haven't formally worked that out.

MS. VOLPE: Okay, so, you're still deciding on who that would be?

DR. KIERNAN: Yes.

MS. VOLPE: Okay, so, would that individual be -- who might that individual be, who would be responsible for overseeing the emergent services?

DR. KIERNAN: The current plan is to, as Dr. Thompson indicated, make this an extension of the Hartford Hospital angioplasty program with physicians currently practicing in Hartford Hospital rotating down there.

Whether or not there would be a specific on-site director or it would be directed from Hartford Hospital has not been worked out yet.

MS. VOLPE: So it would be a rotation, then, with a different doctor rotating?

MR. COHEN: I'm going to object. That's

not what the witness said.

MS. VOLPE: I'm trying to understand.

HEARING OFFICER HANSTED: He's answered. They don't know yet.

MS. VOLPE: They don't know, okay.

HEARING OFFICER HANSTED: Yeah. Let's move on.

MS. VOLPE: Will the program at Backus have a medical director?

DR. KIERNAN: Again, I'm not sure. I would certainly expect that it would, but, again, that has not been formally determined to my knowledge.

MS. VOLPE: Okay, so, in your pre-filing, you state that Dr. Michael Chua Chiaco, who is a private physician, has agreed to provide PCI coverage, is that correct, or is that still being considered?

DR. KIERNAN: That is being considered.

MS. VOLPE: So although the pre-file said he has agreed to provide PCI coverage, has there been a change in circumstances?

DR. KIERNAN: As we thought about the program, we recognize the importance of having experienced operators performing in these cases, so our intention would be to use experienced operators from

Hartford Hospital.

There would be an opportunity perhaps to mentor and work with local providers, who would be involved in the program, and determine whether or not they would be capable of providing that coverage.

MS. VOLPE: Okay, so, I mean, has Dr. Chua Chiaco, since he's been put forth by the Applicant, has he ever done a case at Hartford Hospital for PCI?

DR. KIERNAN: No, he has not.

MS. VOLPE: Okay. I'm not going to ask you anymore question on him. I think you've answered them. Thank you.

Are you aware of whether Backus transfers emergent PCI cases to Lawrence & Memorial?

DR. KIERNAN: I've only seen that or heard that discussed today in the record, but I have no specific knowledge of that.

MS. VOLPE: Okay, so, who -- and you may not be the appropriate person. There might be someone else, who is more appropriate to answer the question. Why doesn't Backus, which is transfer patients to L & M, which is the closest --

MR. COHEN: Dr. Kiernan, you can stay up there, also.

HEARING OFFICER HANSTED: Please introduce yourself.

DR. KYLE McCLAINE: Hello. I'm Kyle McClaine. I've been an emergency medicine physician at Backus since the year 2000, EMS Medical Director at Backus since 2005.

I'm currently the Regional Medical Director for EMS for Region 4, which includes L & M, Backus, Day Kimball and Windham.

I'm also the co-Chairman of the Connecticut EMS Medical Advisory Committee, which is a standing Board of the EMS Advisory Board.

HEARING OFFICER HANSTED: Okay, thank you. Attorney Volpe, your question?

MS. VOLPE: Yes. In that capacity, are you aware of how many minutes L & M is to Backus?

DR. McCLAINE: Yes, and part of the regional plan that was developed with all four hospitals upon the State of Connecticut setting a 30-minute standard of care for transport time, and I'll correct counsel Volpe --

HEARING OFFICER HANSTED: Well, first, just answer her question.

DR. McCLAINE: So, yes. Actually, can you

clarify that part of your question again?

MS. VOLPE: My question is do you know how many minutes it takes to get from your hospital to L & M?

DR. McCLAINE: From Backus to L & M, yes, it takes about 21, 22 minutes.

HEARING OFFICER HANSTED: Okay, thank you. Attorney Volpe?

MS. VOLPE: And how long does it take to get from Backus to Hartford Hospital?

DR. McCLAINE: I'll ask Greg Allard, American Ambulance, who does the transfers. I believe it's in the high twenties, low thirties. Greg, can you clarify?

HEARING OFFICER HANSTED: Is he here?

DR. McCLAINE: Greg Allard is in the back of the room.

HEARING OFFICER HANSTED: Okay, why don't you have him come up?

MR. COHEN: He has to be sworn in.

MS. VOLPE: Yeah, he hasn't been sworn in. That's okay. So is it twice as long, or are you saying -- I mean you're a doctor. You're making a decision. A patient presents himself.

DR. McCLAINE: So it is close, but it's a

little bit closer to L & M.

MS. VOLPE: Closer to L & M?

DR. McCLAINE: Yup.

MS. VOLPE: Okay and, so, if L & M is closer, why does Backus not transfer patients in need of PCI services to L & M?

DR. McCLAINE: So the cases at Backus Hospital that get transferred to L & M are ones that have already been missed by the primary EMS response. Since the inception of L & M's program and after the State helps with a 30-minute guideline for EMS, every EMS case that is identified pre-hospital does go to L & M now, and that includes areas north of Backus.

The ones that are actually diagnosed at Backus Hospital, where you're already in a transfer time of the 120 minutes, this is with the 120 and 90-minute discussion that has been bouncing around the room, it's not 90 minutes or 120 minutes drive time.

It's first medical contact to expectation of a device. That's the 90 and 120-minute standards. A 30-minute drive time is a separate standard, which helps a facility to move towards a 90 or 120-minute timeline, depending on who they are and what they do, so Backus is identified as a 120-minute, not a primary angioplasty

place, so our goal is to get people to definitive care within the 120 minutes.

HEARING OFFICER HANSTED: Okay, now, you mentioned expectation of device. What does that mean?

DR. McCLAINE: So the 90 and the 120-minute standards are first medical contact, which frequently is EMS, which I oversee, and device is catheter in the cath lab.

HEARING OFFICER HANSTED: Okay.

DR. McCLAINE: So that's not door to parking lot. That's not drive time. That's including all the internal processes of all the hospitals involved, and the EMS agencies, and the inter-facility transfer agreements, and EKG acquisition, so I can speak to that.

MS. VOLPE: So let me ask my question directly. You've established that L & M is closer than Hartford, so I'm not talking about a patient in the field. I'm talking about in the ER.

A patient presents, and the hospital professional realizes this patient needs to go somewhere where they have PCI-capable services. Why are they not sent to L & M when it's a closer facility?

DR. McCLAINE: Because the patients that are in the ER at that time are outside, are looking to be

outside of the 90-minute standard, and the 120-minute standard is our expectation that we're able to try to realize 120 minutes for them transferred to several different sites.

MS. VOLPE: But what is your time now? What is the time? You're saying the 90 and 120 are the standard, but what, in reality, is Backus doing? What is your current time?

DR. McCLAINE: So the actual inter-facility transfers are outside of my EMS expertise. They know a little bit more about the actual ED, once they're in the ED and transferred out. They can give you more -- someone else in the room can give you better numbers than I can about the exact number, but it is our goal to hit 120, and that's what we work to do, and we don't always hit it.

MS. VOLPE: But you don't, right. You don't. I mean I think the Applicant states you don't, so what we're trying to determine is why don't you, and we're trying to understand why, if there's a need issue and access, why are patients not transferred to Backus, from Backus to L & M, when it is the closest PCI-capable facility when you're not hitting these national numbers that you'd like to be?

DR. McCLAINE: So the way the question is framed assumes that all the patients in play are already at Backus Hospital, and that is not the case.

MS. VOLPE: Well if they're not evaluated in the field, which you said is already happening, and they're coming to L & M, if they're presenting at your doorstep, you know, either by EMS or showing up, because EMS didn't make the diagnosis in the field, you clearly are transferring patients, who need these services, and you're not transferring them to L & M, so we're trying to understand why.

DR. McCLAINE: Correct. So I can speak as a physician in the department and say that, in the cases where someone walks in the door with crushing chest pain and they're 40 years old, they are the ones that are getting 120 minutes, because those are the ones, and I can tell you the ones that come in by EMS they stay on the stretcher, they get their EKG, and they're back out the door with the same ambulance crew, so I can tell you that those cases are the easy ones.

I think, to actually look at the ones that exceed 120 minutes, there are processes in each hospital that are never perfect, but I think the majority of those cases are delayed presentations.

This is the 80-year-old septic patient with a fever of 102, where you do a routine EKG at a later time when they don't have chest pain, and then you see if (indiscernible) or a patient, who has a trauma, who crashed their car, because they had a cardiac event in their car, and they are at a trauma center, which Backus is and Lawrence is not, and the STEMI rules of transfer are superseded by the trauma rules of evaluation at a trauma center, or a pregnant patient, who is in labor, or a septic patient, all things that mean you can't go directly to the cath lab are the reasons where you don't and you transfer them out.

MS. VOLPE: Okay, thank you.

DR. McCLAINE: For the 40-year-old --

HEARING OFFICER HANSTED: Just let him finish.

MS. VOLPE: Okay.

DR. McCLAINE: For the 40-year-old person, who comes in with crushing chest pain, walks through the door, or comes in by EMS, where they say, Mr. Paramedic Intercept, we don't have an EKG, but this person doesn't look well, those are not 120 misses.

HEARING OFFICER HANSTED: Okay, so, what you're saying, I think, is it's not necessarily the case

that you're missing the 120, because it takes longer to get to Hartford Hospital than L & M?

DR. McCLAINE: Right, but what I'm trying to extend, and this may not be part of her original question, so you can stop me if you wish --

HEARING OFFICER HANSTED: No, I want to hear the information.

DR. McCLAINE: Is that, when you look at this program and how it's developed, we are looking at regions that are far enough away from Backus, where by the time you build in the transfer time to us, you've already violated the 30-minute transfer driving rule.

You, then, have to stabilize. Even at a 15-minute turnaround, you then have to drive 20 minutes to L & M. You're not going to hit a number that's 90.

Yes, we can do 120 with L & M or 120 with Hartford in many of these cases, but the inception of this thing from my standpoint as an EMS provider is that we want 90 minutes to be the standard at Backus, not 120 forwarding on to L & M, or Hartford Hospital, or any other PCI center, and that was the true goal.

Inherent in there they are 120 minutes from someone, who came from Norwich, was a delayed presentation. What was it? There are cases to look at

case-by-case. The larger goal is to set a 90-minute standard for the communities that surround this proposed cath lab versus a 120-minute standard that is currently the standard by where we are, which would change that fundamental number from 90 to 120.

And even I think the other folks in the room can verify that there is a survival benefit and a heart benefit to the difference in those two numbers, and that is what we can achieve with a PCI --

HEARING OFFICER HANSTED: Okay. All right, thank you, Doctor.

MS. VOLPE: Okay. If the doctor could be provided with page 26 of the Applicant's application, I think it would be helpful in responding to my specific question, and I'll ask it again.

MR. COHEN: Hold on. Hold on one second until we get it out. Are you talking about bates stamped page 26?

MS. VOLPE: Let me just make sure. No. 473.

HEARING OFFICER HANSTED: Let's go off the record just for a minute, just so we can take the time to make sure we're all on the same page here.

(Off the record)

HEARING OFFICER HANSTED: Okay, so, we're talking about page 473 of the application. Attorney Volpe, you may proceed.

MS. VOLPE: Yes, so, can you tell us what is the median door-to-balloon time in minutes for Backus?

DR. McCLAINE: They said from 2011 through May of '15 the median time is 134 minutes.

MS. VOLPE: Okay, so, that's clearly below the standards required, right, and Hartford Hospital is further, correct? So, again, if you want to hit the quality standards, why is Backus not referring to a closer PCI-capable facility?

DR. McCLAINE: I see the question, and I see the data. I don't have an answer.

MS. VOLPE: Okay.

DR. FOLEY: May I just?

HEARING OFFICER HANSTED: Yes. Just identify yourself, please?

DR. FOLEY: John Foley. So, at the beginning of this period, we started to look at door-to-balloon times in every patient and certainly discovered that it was unacceptably high, and we have been sort of attacking this in trying to go through metrics within the emergency room, in terms of -- they used to call

cardiology. Cardiology would weigh in on an opinion, see the patient, if possible. There were inherent delays in the process that we have eliminated, so I think that the more recent record would reflect that our door-to-balloon times continue to improve, not that in every case we meet them, but that we are significantly better now than we were during the initial period of this monitoring, where we had some really, you know, we approached the MI similar to other cardiac issues, and we know that that's not appropriate.

The ER is equipped with decision-making capabilities to transfer drug boxes to eliminate pharmacy. We've done a lot of internal process changes to address what was an unacceptably high door-to-balloon time.

MS. VOLPE: Okay, so, can I ask you, Dr. Foley, why does Backus not transfer PCI patients to L & M when it's closer? And we've all established it's closer by miles, by drive time, so why do they not get transferred?

If we are genuinely worried about heart muscle and time period, why are they not going to the closest PCI provider?

DR. FOLEY: So I think, in answer to the

question, if you look at the groups that we have within Norwich, so we now have a Yale group, I was a member of that group initially, we weren't necessarily part of Yale when I was there, but they are now, but we were certainly aligned with Yale, so physician preference and patient preference, patient history, many of these people have had prior interactions with either Yale or Hartford before, so we respected those relationships.

From a care fragmentation and communication point of view, it made a lot of sense, it makes a lot of sense that we are providing care within a system, which we have found, just like if you were asking a Yale physician here where do they send their patients from the emergency department, it would Yale-New Haven.

So if the question is why don't patients from the emergency department at Hartford Hospital, I mean at Backus Hospital, you know, not go to Lawrence, I would say, well, when the docs from Yale are on, they're sending the patients not to Lawrence, but to Yale-New Haven Hospital, and they're on call in an equal amount of time that we are, so I think even Yale recognizes that within the framework of a system and communication that it's better care to stay within that aligned model.

MS. VOLPE: Dr. Foley, if a patient

presents themselves at the ER, however they get there, they're dying of a heart attack, I don't think they're determining a preference, they're not deciding, oh, I, you know, I like Yale better, send me to Yale.

It's the professional, who is making the decision, and you have a closer PCI-capable. I still, from a layman's perspective, tell us why aren't those patients going to a closer facility that can take care of their immediate need?

DR. FOLEY: Because the care provided historically was the patients were sent more to Yale than to Hartford. That is now different. The care that these dying patients are getting has been excellent, and the outcomes have been excellent.

And from an institution and a provider standpoint, in our best opinion at the time, that was the best place to send them, because we're not talking -- we're talking about, you know, we're talking about outcomes, and the outcomes have been good.

MS. VOLPE: Right, but how can you say it's been excellent if you're not meeting quality minute standards? If your median time is 134, how is that excellent when it falls below the national heart organization standards, the SCAI and that? How is that

excellent?

DR. FOLEY: Well I'm not sure that I would agree that our door-to-balloon now is 134 minutes, and I think that that's data that we can certainly look at, but I thought it was less than that.

MS. VOLPE: That's what's been established in the application.

DR. FOLEY: Okay, so, I'm sorry. Your question?

MS. VOLPE: My question was you're saying these patients are getting excellent quality service, and I guess, again, I'm not a doctor, but if somebody said, well, the standard of care for this service is 120 minutes to get what they need and you're doing it in 134, how is that excellent quality service care?

DR. FOLEY: I think the question is great, because it recognizes quality of care is important and time to cath and balloon is important, which is why we're sitting here.

We're asking, actually, for a cath lab, so that we can hold to the standards of 90 minutes, which is certainly quicker than 120.

We acknowledge that what we're providing now is not the type of care we'd want to provide, nor the

care that we could provide. That's why we're sitting here, you know, with this application.

MS. VOLPE: Right, but if you have a provider in your service area within a short period of time minute drive and that provider could do it within the same time period if you were to have a duplicative service, again, why aren't these patients being sent to the closest PCI provider?

DR. FOLEY: Well I would disagree that, if we had a cath lab, that it would be the same amount of time.

MS. VOLPE: How long does it take to setup a cath lab for a patient when they present?

DR. FOLEY: But it wouldn't also involve tying up an ambulance and transferring a person from one place to another with all the communication issues of talking about the patient and how much is done at Hospital A, and then how much is delayed to Hospital B.

If we had a cath lab, were we able to activate a cath lab, I can't imagine that my colleagues in cardiology would agree that opening an artery quicker in the same institution isn't better than transfer, by the same reason that the transfer to Hartford is we're being, you know, sort of looked at for door-to-balloon

time of over 120. We're saying we should be shorter.

HEARING OFFICER HANSTED: Doctor, I understand that you're here to get that program, to try to get that program, but the question really is, aside from Backus having a PCI program, historically, it's clear from the evidence in the record that Backus Hospital has been transferring patients in higher quantities to both Yale and Hartford Hospital rather than L & M, and L & M is clearly closer than either of those two hospitals. Why has that been done?

DR. FOLEY: I'd have to say that it's historical. It is, to some degree, historical practice with providers at institutions being aligned with and able to communicate and negotiate care.

HEARING OFFICER HANSTED: So it's physician referral?

DR. FOLEY: And patients, when I've been asked, you know, we ask them where they want to go. In the case of a patient that comes in in shock, you're right. We're not asking them, but patients are asked in the emergency department where they want to go.

I mean they're given the choice, and they're selecting Harford or Yale, and that's the way they're going.

HEARING OFFICER HANSTED: I understand that, and I don't disagree with that, to the extent you've testified to that, but is there a certain amount of physician referral pattern going on here?

DR. FOLEY: Well I think, in a referral pattern, it's another way really of saying, you know, communication and relationships and trust.

HEARING OFFICER HANSTED: Right.

DR. FOLEY: And trust, that I'm now taking a very sick person and putting them in an ambulance and sending them to someplace, and who is going to be on the other end, and who is going to take care of them, and that is a relationship historically, which I felt very comfortable with patients going to Hartford.

HEARING OFFICER HANSTED: That's fine. I'm not belittling.

DR. FOLEY: Oh, no, no, no. I hear you.

HEARING OFFICER HANSTED: I'm just trying to get that out there. I think that's the elephant in the room here.

DR. FOLEY: Sure.

HEARING OFFICER HANSTED: And we just need to -- I think that's what you're trying to get at, Attorney Volpe, and I want to try and get an answer to

this question today.

DR. FOLEY: Sure. And I hope I've answered it. I know I talk a lot. Sorry.

HEARING OFFICER HANSTED: That's all right.

MS. VOLPE: Thank you. So maybe this is better directed to Dr. Foley. Does Backus routinely care for STEMI patients in the hospital now?

DR. FOLEY: I would say we do not routinely care for STEMI patients now. In the emergency department, but, no, we're not admitting STEMI patients for obvious reasons. Angioplasty is better.

MS. VOLPE: So do you have current support staff, nursing staff techs, who are comfortable with these patients if you're not currently taking care of them?

DR. FOLEY: And that question or those comments came up earlier, and I think it's an important question, and I'll try to be very brief.

HEARING OFFICER HANSTED: No, no, no. I did not mean to cut you off.

DR. FOLEY: Oh, no, no, no, but I know. My wife tells me I go on, and on, and on.

HEARING OFFICER HANSTED: Take your time.

DR. FOLEY: So it's not the first time, but I'll try to be brief. So when I first came to Backus in 1999, we handled MIs all the time, because we didn't have a thing called angioplasty readily available. We familiarized everybody, and the outcomes were not very good, so I'm glad we're not returning to that, but we treated those sick patients, and now we are triaging them, and the goal is to get them into a cath lab quickly.

So do we have nurses and doctors, who can take care of a STEMI? Absolutely. Do we take care of a lot of them? Absolutely not. Like with any program, and I would argue that before Lawrence & Memorial did PCI, their staff would have been in the same situation, and it behooves us to train, we've begun that training.

Our cath lab nurses and intervention radiology nurses have not only switched with each other, so that we're learning the whole idea about being on call and how to handle balloons and wires, but they've also gone to Hartford Hospital and got a training in the cath lab, so I just wanted to, for the record, to say that the training, the advanced training for these folks, is not just in an interventional radiology suite, because I agree that that's not comparable training, but the

training has already begun with the staff.

Will we have to do a lot more?

Absolutely. There are already committees in place. Becky Durham, who is one of our sort of Directors, who is behind me, can probably comment better than I, but we've already put in place the framework for how we would do the training needed, whether it would be balloons, or ICU, or whatever.

HEARING OFFICER HANSTED: Okay. Did you want to have her?

MS. VOLPE: No, I don't.

HEARING OFFICER HANSTED: Okay.

MR. COHEN: I thought the agreement at the beginning was --

HEARING OFFICER HANSTED: No, no, no, no, no.

MR. COHEN: -- that whoever is the best --

MS. VOLPE: To get my question answered.

MR. COHEN: -- able to answer the question.

HEARING OFFICER HANSTED: But if she's --

COURT REPORTER: I can only record one person at a time.

HEARING OFFICER HANSTED: And I get to

talk. If she's satisfied with that answer, then she can move along.

MR. COHEN: I can address it on Redirect, then.

HEARING OFFICER HANSTED: You can address it on Redirect.

MS. VOLPE: So I'll just stay with you, Dr. Foley. Improving patient care and access is priority, would you agree?

DR. FOLEY: Absolutely.

MS. VOLPE: Okay and, as a sponsoring hospital with EMS, do you think it's appropriate to put the funding into detecting these patients, who need this service out in the field? I think that the importance is quickly identifying the need, right, and the concern when someone presents.

MR. COHEN: I think Kyle, Dr. McClaine --

MS. VOLPE: Would it be better to identify them in the field, even before they present at the hospital?

DR. McCLAINE: So the point that you're alluding to is the transmission of 1280 EKGs and who is (coughing) and what you can do with them, and that's a great question, and the answer is, when you have a choice

of two places within equally distant or less than 30-minute distance between them, then using an EKG to tell you where you're going to go, whether one is a PCI center or one is not, is a very good thing.

When you're up in the north and you're beyond the 30-minute mark to a PCI center and you don't have the ability to choose where you're going, a BLS provider, specifically, has to go to the closest facility, and then it becomes a transfer situation.

So you're making reference to the BLS 12-lead acquisition project that the State of Connecticut put forward, and I was on the committee that was approving that pilot program and approving the stuff through the CHEMSMAC, which we then gave to the Commissioner, who then released that statement, and it was done for a very specific reason, and that was in the western part of the state.

There were three hospitals in very close proximity to one another. One was a cath lab, two are not, and there's a paucity of paramedics in that region of the state, and there was no one to do an EKG, so the BLS provider was at the house in five minutes, they were looking at someone, who has chest pain. They don't know whether they were having a heart attack or not, and

they're looking at two hospitals. They can almost see them both from the guy's mailbox, and they're saying where do we go?

So they said this is a spot where we need more paramedics. We can't get more paramedics. Who else can do an EKG? So they piloted a program, by which the hospitals agreed we need to decide who has a STEMI and not, because we want primary less than 90-minute angioplasty instead of getting into the 120-minute ballgame with transfers.

So what they did was is they had a system, where they can't even look at the EKG. They have a black box, they attach it to the patient, it gets beamed to one of the hospitals, who then reads the EKG and says that's a STEMI. Go to the PCI center. That's not a STEMI. Go to the other hospital. And they piloted that program, and it worked very well, but that was a very specific need, where you had two hospitals close together and you had to pick which one.

Now, in Norwich, that still exists, and anywhere where there's a paramedic that's already taken care of. Paramedics have been doing EKGs for a long time. They don't have to transmit them. They can transmit them, but their own reading of the EKG is a

national standard that's adequate with an acceptable false positive and negative activation of a cath lab, so paramedics can read EKGs. If they can transmit them, that's great, too, but they're not the problem.

The problem is the BLS provider, and this is exactly one of the access to care issues in the northern part of the state, where you exceed a 30-minute drive time to Lawrence & Memorial Hospital, and you have BLS providers and a paucity of paramedics, as well, to be truthful, and herein lies the problem, whether or not the BLS provider or the paramedic gets an EKG, if you're more than 30 minutes past L & M, is a problem, because then you're into the -- you're supposed to stop at the closest hospital, and then you become a transfer patient, and a transfer patient sets up a different standard of times, but it's also not the best for the patient.

You're looking for, you know, if you're the patient, you want to offer every patient the ability to get their vessel opened in 90 minutes, so a primary PCI center.

So to cut through what will likely be a question later, why not BLS 12-lead transmission now, because they don't have a choice. They're still going to the same hospital, regardless.

And the next thing is, if we have a cath lab, would there be BLS 12-lead transmission? Absolutely. It's part of my plan, because then you have an option.

If you're near the Backus Plainfield, 10 minutes past Backus Plainfield towards Day Kimball and you get a 12-lead that says it's a STEMI, now you can drive down to Backus for your primary PCI versus stopping at Backus Plainfield or Day Kimball and then getting transferred to UMass.

HEARING OFFICER HANSTED: Okay, thank you.

DR. McCLAINE: Or Hartford.

MS. VOLPE: So the cost of implementing this EKG 12-lead, are you familiar with --

DR. McCLAINE: Yeah, so, you have to ask each ambulance to buy a unit that would do transmission. You have to get a hospital to buy the equipment and the ability to receive it and interpret it, and if you're a place that's going to, then, offer the patient a different option, it's much less than the cost of flying somebody or taking them out of network.

It's not a huge cost, but it is a real cost that you have to ask the Town to do and each ambulance in the Town to do. It's actually something,

where it was piloted for the reason that I told you earlier, and that is one of the few towns in Connecticut that actually to do it. None of the Lawrence & Memorial services have BLS providers doing transmission of 12 leads by BLS and, currently, none of Backus do either, because we're not giving them a choice where they're going to do something different with the data and there is a cost, but in cases, where you can make a patient outcome difference, it's worth the cost.

MS. VOLPE: If Backus receives information on a patient from an ambulance 12-lead EKG that they require a PCI, what does Backus do?

DR. McCLAINE: Backus doesn't receive that information at all. If the person is within 30 minutes, Backus never hears about it, and it becomes one of your, L & M's cases, or Hartford's cases, or wherever they can get in 30 minutes, depending on where they are.

If they're in Colchester, they're going right to Hartford. If they are in towns, such as Ledyard, Lisbon, like that, they go right to L & M, because there is a cath lab within 30 minutes, and they've identified the STEMI, so we never even hear about it.

MS. VOLPE: Right, because there's a cath

lab available within 30 minutes.

DR. McCLAINE: Right.

MS. VOLPE: Of all those.

DR. McCLAINE: And by this town analysis, there is 11 of 28 towns that are within 30 minutes of a PCI center, not including Backus.

MS. VOLPE: Correct.

DR. McCLAINE: And there are 17 of 28 that Backus would be the closest and for primary angioplasty, too, that is not within 30 minutes of L & M or anyone else.

MS. VOLPE: Well the or anyone else, I don't know that that's --

DR. McCLAINE: There are 17 of 28 people, towns that are not on your list that Backus would be the closest town, closest cath lab to and within 30 minutes where no one else is in 30 minutes.

MS. VOLPE: Well that last statement is not accurate, and I think we're going to get a late file on that.

DR. McCLAINE: Sure. And then, within each town and the other part of EMS that I think is hugely important, is that whether you do it by town, the center or town, the corner of town and zip code or not

does not take into account real life EMS, as I've been part of most of my whole life, and that is the center of town is not the only point of measure for real EMS response times.

You don't take into account weather, where you are close to the highway, where you have to turn around or not, and a thousand things that effect aeromedical transport, effect ground transport. There's several days, and I've sent a STEMI from Backus Plainfield to Hartford via 17 different ways, but, on a rainy, snowy day, when Life Star is not flying, it can be 40 minutes to get to Backus from Plainfield, not 17, and that's a real life thing that happens often, with traffic and weather.

And within each town, earlier it was discussed about do we do it from the center of town, do we do it by zip code, I'd say do it from 25 parts of every town and see what your real numbers are, because real transport times are not best case scenario Google maps on a sunny day, which is where all of these numbers come in.

And, to be truthful, on both sides of the coin, it should be looked at, but, in truth, real life transport, when you're 15, 20 minutes north of Backus,

which is 15 or 20 minutes down and then another 20 minutes to L & M, factoring in cath lab activation time and all that stuff, it's hard to make the 90, and it's hard to make the 90 even when you say you're within 30, but, for the strict analysis, there are several, 17 to be specific, where they can't make the 30 to anywhere else by this chart that was actually filed by you guys.

MS. VOLPE: So do you, personally, transfer patients to another PCI facility?

DR. McCLAINE: So, as a physician in the department, I have.

MS. VOLPE: Yes, you have.

DR. McCLAINE: And I've been one of the ones that have sent them to L & M, and I've been one of the ones that have sent them to Hartford.

MS. VOLPE: Oh, you've sent them to L & M?

DR. McCLAINE: I have.

MS. VOLPE: How many have you sent to L & M?

DR. McCLAINE: I was one of those three, and it was a snowstorm, and it was -- and I don't think we made 90 or even 120 on that patient, because I think even that snowstorm trip to L & M was probably an hour.

HEARING OFFICER HANSTED: Did you say you

sent three, or you were one of the three?

DR. McCLAINE: I sent one of those three.

HEARING OFFICER HANSTED: One of the three.

DR. McCLAINE: And I routinely send ones to Hartford, as well, but when I send someone to Hartford, they don't leave the EMS stretcher, and they turn around immediately.

HEARING OFFICER HANSTED: Okay.

MS. VOLPE: Okay, so, just in staying with that, because this is a question we wanted to get answered, you acknowledge that, over the years of us having the program, Backus has sent three patients to L & M.

You, personally, sent one, and can you tell us why you sent that one patient?

DR. McCLAINE: Yes. There was a snowstorm, and there was no way they were going to make even 120 in any direction, if I remember correctly, and that was picking, of all the bad scenarios, the one that was the best for the patient, and my own patients that I send to Hartford the same is true.

I don't send them, unless I expect they're going to make the metric.

MS. VOLPE: So you're confident that you can make the metric in sending your patients to another PCI facility within the quality times?

DR. McCLAINE: I am.

MS. VOLPE: Okay and even though we've established the median time is longer than the quality set standards?

DR. McCLAINE: Right, and I'm one of the ones that does go back and say look at your times. If you can't make your metrics, then we have to do better, and we've looked at seeing what our options are.

MS. VOLPE: Okay and if you know you can't get a patient within the 120, which is the time period that you're held to as a non-capable PCI, what is the protocol? What do you do if you can't transfer a patient within the quality indicator time protocol?

DR. McCLAINE: So the standard ones are give lytics, or that's your option. If you can't make 120, you give lytics.

MS. VOLPE: Give lytics, is that another name for fibrinolosis?

DR. McCLAINE: Fibrinolytics, yes.

MS. VOLPE: So close.

HEARING OFFICER HANSTED: I don't know

what either of those are, so can you explain them?

MR. COHEN: Well you've got the right guy to answer the question.

DR. McCLAINE: So, as Dr. Foley mentioned, before the availability of mechanical opening of an artery, the best next thing we could do would be to give a, for a layman's term, clot busting medication, a medicine that dissolves an existing clot, and that was the only therapy that was available before angioplasty and PCI stenting and bypass surgery, that kind of stuff, and it's now been found in the literature to be substandard to opening the vessels in 120 minutes.

HEARING OFFICER HANSTED: Okay. Thank you.

MS. VOLPE: So because you're confident that you could meet the 120, even though you're not transferring them to Backus, I mean to L & M, you're transferring them to Hartford, you've never administered that drug, or have you administered that drug?

DR. McCLAINE: In the cases that I have had, I've now had to, but I would, if I really felt that there was no other option, but, to be truthful, along the way this is not static data point. There were a lot of steps along the way, where it was give the thrombolytic,

give half dose lytic, give lytic plus this, give lytic plus that, and there was a lot of variability amongst even the PCI centers, as to whether they wanted to do that, including some of the receiving PCI centers, saying in 120, 140, let's not do the thrombolytic, so those discussions just happened.

That's not absolutely been agreed upon all the way along. It's written as the current standard, and I think it would be the current answer that most ER physicians would give you and most cath labs would be okay with, but, in truth, there was a lot of resistance to getting really close to that number and not having the additional complications of the lytic.

And Dr. Cambi is an interventionalist, as well as others in the room, and I'm not, but that was thrown up as, you know, for close, let's not do that lytic. We don't want that mess.

MS. VOLPE: Okay, so, can we go back to this need for EMS to be equipped in the field to make a diagnoses?

DR. McCLAINE: Right.

MS. VOLPE: Do sponsoring hospitals play a role in that?

DR. McCLAINE: Yes, they do.

MS. VOLPE: And what is the role that they would play?

DR. McCLAINE: The state provides the bag of tricks that you have to sample from. The sponsor hospital decides in their own region what of those tricks could benefit a patient and be something that could be sustainable or feasible.

MS. VOLPE: So what can Backus do to improve this provision of EMS providers in the field with this capability?

DR. McCLAINE: So, currently, in the areas surrounding Norwich and the areas where we truly overlap, if there were two PCI centers, there’s a very, very good density of paramedics that currently obtain 12-lead EKGs and use them to make a decision and pick a destination hospital.

They do that well. They do that already. In the areas that are north of us, they currently don’t have anything to do with the information that they would get for the cost and the time that they spent. They’re not going to go to a different hospital.

The moment that an option exists, it opens up the discussion, as to say this is a spot where BLS 12-lead acquisition by non-paramedic providers could be

something that may help tell a patient which way to go and tell the ambulance which way to take the patient, and then you have to decide who is going to pay for all these ambulances to have this, and some costs will end up being shifted to them, a lot will be shifted to the hospitals, as well, and you have to, to justify that, you have to say, when they go their towns and say we're a volunteer ambulance for the town of, you know, pick your town north of Norwich, Canterbury, you know, and we're currently not able to make it somewhere, you know, if we do this, is it going to change which way we point on the highway, and the answer is currently no.

If there's an option, yes, and then we work on who is going to help them get that.

MS. VOLPE: So five million dollars could certainly pay for a lot of 12-lead EKGs in the field.

DR. McCLAINE: But, with all due respect, counsel, that doesn't change the fact that there's not a place for them to take the patient.

MS. VOLPE: Well I think, if we look at the chart within the quality 30-minute drive, there are lots, there are lots of places to take the patient with PCI capability --

DR. McCLAINE: You would have to find the

ones that don't have a paramedic available to do a timely EKG, which are very few areas, to be honest. Even within the zone, there are very few of those areas.

MS. VOLPE: Well, again, that's my question. It's all the same money. It's health care dollars. It's state resources. It's charitable organization. It's funding. It's patient. It's health plans.

DR. McCLAINE: My answer to your question, counsel, is that the extra money doesn't give them a place to go without another cath lab.

The ones that can get the data now use the data and go to the existing providers that they have. Extra EKGs in an area that doesn't have a cath lab, no matter how much you spend or don't spend, doesn't change the fact they don't have access.

MS. VOLPE: But, again, back to our question. Of the 26 towns, there are 24 of them within a 30 to 35-minute drive time to a PCI-capable facility, so our question is is the money better spent determining in the field whether this patient is presenting with a heart attack, based on a 12-lead EKG, than setting up a duplicative service within a 17-mile radius?

DR. McCLAINE: I hear what you're saying,

but the State of Connecticut set a 30-minute target, and, as we've talked about, there's a lot of arguing about exactly 20, or 30, or 35, or 40 within a town, but the EMS providers have the instructions from EMS, which is the same for L & M and Backus and Day Kimball and Windham, to say, if you are wherever the heck you are, 30 minutes to a PCI center, get the EKG and go there, and my answer to you is is that none of them have currently raised their hand to say I've got two choices. If I could just get that EKG, I would direct the patient for you. That does not currently exist.

With another PCI center in the region, there are some times when that would exist, and you now have a choice between the PCI center and the non-PCI center, but not everybody who is weak and dizzy is going to the PCI center automatically.

HEARING OFFICER HANSTED: Thank you, Doctor.

MR. COHEN: One of our other witnesses has some additional information on this.

DR. THOMPSON: So this is Paul Thompson. I'm the Chief of Cardiology at Hartford Hospital. I want to point out that I think this is a moot point, because I tried to buy these four ambulances and was told that it

was a Stark Law violation, that I was giving money to a group that could potentially refer patients to my institution.

DR. McCLAINE: So I think, as far as the Stark Law goes, it basically says if you're going to do something for one, you have do it for all, and you can't use it to --

HEARING OFFICER HANSTED: Right. No, I'm familiar with it.

DR. McCLAINE: Yeah. My apologies. So I was faced with that. I was faced with that very question and -- I'll direct it to you. I'm sorry. In that we would offer, if it were to be offered, if we could find a place that we can do an EKG and redirect a patient, we would have to say we will help you fund this, if we're going to do it for everybody, and we absolutely will, but what has really happened since this 12-lead pilot program began was that there was only one pocket of the state, like I said, that had within the confines of here to the parking lot there were two hospitals, one was a PCI, one wasn't, and the paramedic wasn't there for 10 or 15 more minutes, and the BLS provider was saying I don't know where it is. Where do I go?

And it answered that question for them

beautifully, and it still does, but it doesn't answer the question that we have here.

HEARING OFFICER HANSTED: Right. Okay, thank you, Doctor. Let's move on from this question. I think we've heard enough.

MS. VOLPE: Sure. Gladly. And this might be more appropriate for one of the physicians, who is familiar with the guidelines, the ACC/AHA 2014 guidelines and the DPH 2012, so I guess --

HEARING OFFICER HANSTED: Wait. Before you get to your question, who would be most familiar with this?

MR. COHEN: Well I think it would be Dr. Kiernan and Dr. Foley.

MS. VOLPE: Nice to have you back, Dr. Kiernan. So in the application, you rely heavily on the 2012 guidelines for STEMI patients in your application and you ignore the guidelines in the most recent ACC/AHA for 2014, stating, you know, here's the criteria, here's the update on PCI without on-site surgical backup for emergency transfers, so, specifically, why is that? Why are you relying on that, as opposed to the most recent ones? Do you know?

DR. FOLEY: I think your question is why

do we not rely on the latest --

MS. VOLPE: Correct.

DR. FOLEY: -- iteration.

MS. VOLPE: Yes.

DR. FOLEY: And I don't know if it's a timing of submission and preparations in the court, but now that I've come up here (multiple conversations) it's a rationale question about why the guidelines we chose were the ones we chose.

MS. EDWARDS: We submitted the 2014 guidelines with our application.

MS. VOLPE: Right, but your application, if you submitted a 2014, they state that, if you have a PCI-capable facility within a 30-minute drive, that you should not have another facility with PCI capability, so how do we reconcile that? How do you reconcile that for this Commission?

DR. KIERNAN: That's correct. The guidelines do recommend not establishing another center within a 30-minute drive of another center, however, we're talking about writing services to patients that are well north of L & M, for example. It would be closer for them to come to Backus for treatment, and that's the rationale.

MS. VOLPE: So, based on that, your recommendation would be to have this Commission go against the national guidelines and allow --

MR. COHEN: I'm going to object to that, because that wasn't what his testimony was. His testimony wasn't that he was going to go against the guidelines, and counsel is summarizing and misstating the exact items. Can you read them to us, please?

HEARING OFFICER HANSTED: No, no, no, counsel. I don't want you to ask that question. I don't think I want him to testify, as to whether or not he wants the zip code against the national guidelines.

I think it's clear what they're asking for. They've submitted evidence, and we know what the guidelines are, so we'll make the determination whether or not it goes against the guidelines or in favor of.

MS. VOLPE: Okay, as long as everyone is aware of the guidelines.

HEARING OFFICER HANSTED: They're in the record, the 2014 guidelines.

MS. VOLPE: Okay. Just give me one moment.

HEARING OFFICER HANSTED: And just while they're speaking, just for the record, the guidelines

start on page 112 for the record.

MR. COHEN: Thank you.

HEARING OFFICER HANSTED: You're welcome.

MS. VOLPE: Okay. Our next questions relate to the financials of the project.

HEARING OFFICER HANSTED: So, Doctor, you can have a seat.

MS. VOLPE: Thank you, Dr. Foley. Thank you, Dr. Kiernan.

HEARING OFFICER HANSTED: Relate to the financials, so your financial individual.

MR. DAN LOHR: Good afternoon. I'm Dan Lohr, Regional V.P. of Finance.

HEARING OFFICER HANSTED: Good afternoon.

MS. VOLPE: Dan, I have to go easy on you, Dan. I like you, Dan. I'm kidding.

HEARING OFFICER HANSTED: Not that she doesn't like you.

MS. VOLPE: I like everyone else, but I particularly like Dan.

HEARING OFFICER HANSTED: Do we have a conflict here, Attorney Volpe?

MS. VOLPE: No conflict.

HEARING OFFICER HANSTED: Okay.

MS. VOLPE: So, Dan, what is the cost of implementing this program for the hospital?

MR. LOHR: Cost, in terms of the capital you've referred to earlier in the five-million-dollar, four-and-a-half-million-dollar range, annual cost, if you refer to that, is a loss of the program.

It ramps from I think the mid-$300,000 loss up to maybe a five or five and a half.

MS. VOLPE: Five and a half?

MR. LOHR: 500,000.

MS. VOLPE: 500,000, okay. So, of the initial capital outlay of the five million in capital, where would that be coming from in the hospital's resources? Would that be a debt service, or do you have money on hand?

MR. LOHR: It would be funded from operations.

MS. VOLPE: Funded from operations, okay. And, so, you have five million dollars in capital available to fund this?

MR. LOHR: Yes.

MS. VOLPE: Without changing any of your other programs?

MR. LOHR: Yes.

MS. VOLPE: Okay and how will the continued losses for the program be funded? How will those be funded?

MR. LOHR: In the projections, we're continuing to project a positive bottom line, so the losses would be funded from operations.

MS. VOLPE: Okay and is it Backus's position that no other programs would be discontinued or suffer funding, based on implementation of this program?

MR. LOHR: My opinion, and I'll perhaps defer to more the strategy-minded individuals, but there's enough of an operating margin to cover the program, so there shouldn't be any other reductions.

MS. VOLPE: Okay, so, I just want to make sure I asked this question clearly. Implementation of this program would require no, absolutely no other programmatic changes at the hospital, in order to implement this program?

HEARING OFFICER HANSTED: In terms of cost?

MS. VOLPE: Cost, correct. Thank you, Kevin.

MR. LOHR: In terms of cost, I don't believe so.

MS. VOLPE: Okay and, as part of the application, I think it's on 381, your financials -- let me make sure. The date, the stamp is it -- oh, 1443. Thank you. That is really tiny. 1443.

MR. COHEN: If you can hold one second, I'll get it out.

MS. VOLPE: Yes. Page 1443.

MR. COHEN: Wow, it is small.

MS. VOLPE: Do you have a bigger copy for Mr. Lohr?

MR. COHEN: Do you have magnifying glasses?

MS. VOLPE: Nobody has a bigger copy for Mr. Lohr? Let me share my copy with you.

MR. COHEN: This is what CFOs have to deal with.

HEARING OFFICER HANSTED: Can you read it okay? I mean I don't want you testifying if you can't read it.

MR. LOHR: No, I can see it. I can see.

HEARING OFFICER HANSTED: Okay.

MS. VOLPE: We just want to see if we can get you a bigger copy.

MR. LOHR: This is fine. Really, this is

fine.

HEARING OFFICER HANSTED: I just want to go off the record for a minute.

(Off the record)

MS. VOLPE: Okay, so, we've already had Dr. Thompson and I believe Dr. Foley testify that they'd be bringing in staff, as needed, to deliver these services in accordance with, you know, proper staffing requirements, and you may not know the answer to this particular question, but the Applicant had stated a certain level of staffing for their cath lab and, then, in the application, and then changed it in the completeness questions.

So, according to your projections on this financial, how many new staff would be required for this program?

MR. LOHR: Down toward the bottom of the page, I believe it's line D, we're projecting basically two additional staff for the program incrementally, which would not include the --

HEARING OFFICER HANSTED: If you could just keep your voice up for the microphone, please?

MR. LOHR: Sure. Two additional staff for the program, which would not include the call, on-call

physicians.

MS. VOLPE: So no physicians are in this FTE number?

MR. LOHR: No.

MS. VOLPE: Okay and the staff that would be new, based on this projection, what area would they come from? Are they administrative? Are they clinical?

MR. LOHR: They would be clinical.

MS. VOLPE: Okay, so, two additional clinical staff, and who would those be?

MR. COHEN: Well we have someone, I think, who is better able to answer that question.

HEARING OFFICER HANSTED: Okay, why don't you have them come up, if they can better answer it?

MR. COHEN: Becky? This is on staffing questions.

MS. VOLPE: Well it is, as it relates to the financial pro forma, but, yes, let's get this.

HEARING OFFICER HANSTED: Right, so, she'll answer the questions specific to who will the staff be, period.

MR. COHEN: Correct.

MS. VOLPE: Yes.

MS. REBECCA DURHAM: I can do that. My

name is Rebecca Durham, Backus Hospital. The staff would be one cardiovascular technician and one registered nurse.

HEARING OFFICER HANSTED: Okay, thank you.

MS. VOLPE: So the one cardiac tech and the one registered nurse would be new hires?

MS. DURHAM: That's correct.

MS. VOLPE: And, so, the existing staff that would be redirected, who would they be? Let me rephrase that for you. The existing staff that would be redirected, would they be techs, nurses, or a combination? Do you know what's required to staff the cath lab? What is the staffing requirement for one cath lab?

MS. DURHAM: For our current cath lab, we have two techs. One is a C.V. tech, one is a tech at the table, and a registered nurse.

MS. VOLPE: Okay and that's for a diagnostic lab, correct?

MS. DURHAM: That is correct.

MS. VOLPE: And for a primary PCI cath, what would the staffing needs be?

MS. DURHAM: For Monday through Friday, it would still be two techs and an RN, with the ability to

pull in an RN to help, as needed, and then, on the off shifts, the on-call staff would be the same, a tech, or two techs, C.V. tech, tech at the table, an RN, and the ability to shift resources from our ICU if the patient was deemed unstable and needs the second nurse to come to help.

MS. VOLPE: So you, right now, you would have two cath labs, you're saying, with four techs in total, and potentially two to three nurses, right, if you have two -- you're proposing to have two cath labs in this.

MS. DURHAM: So if you're talking about two cath labs in the procedure room, we would have a nurse in each room, and then a C.V. tech, and a tech at the table in each room.

MS. VOLPE: And, so, based on this, they're proposing only two FTEs, so you have enough now to overstaff your current cath lab, since you have just a diagnostic cath lab now?

MS. DURHAM: Currently, our staff is cross-trained with our interventional radiology nurses, so we have a combination of staff, so we do currently have enough staff to be able to perform those procedures.

MS. VOLPE: And do you know what the

staffing standard is for the guidelines for an interventional cath lab?

MS. DURHAM: Not off the top of my head.

MS. VOLPE: Does anybody know that? Because it's changed. I think it's important for the record.

HEARING OFFICER HANSTED: Counsel, do you have someone that is qualified to testify?

MR. COHEN: Yes, we do.

HEARING OFFICER HANSTED: Okay. Just identify yourself for the record, please?

MS. MARIANE CARNA: This is Mariane Carna. So the same staffing levels, at Hartford Hospital, two RNs in the room to one technician would be the same standard we would apply at Backus Hospital at pulling our policies and protocols across the institute.

MS. VOLPE: Okay. I don't have any other questions on your staffing. For Mr. Lohr, I just want to make sure we don't have any other financial questions. Just give me one second.

Okay, so, the funding for this program, if it's going to be in conjunction with Hartford Hospital, since they are going to be providing a lot of the clinical expertise, is it contemplated that there would

be a financial arrangement for the provision of those services to Backus from the Hartford Hospital doctors?

MR. LOHR: The financial arrangement would be call coverage.

MS. VOLPE: So they would just be paid for call coverage. Is it built into this pro forma, the call coverage payments?

MR. LOHR: Yes.

MS. VOLPE: Okay and where are those?

MR. LOHR: They're netted in the revenue.

MS. VOLPE: So is it a separate line item?

MR. LOHR: No.

MS. VOLPE: I did work for Arthur Andersen one year, a few years, but I'm not a financial person. Is it in here? Is the call coverage number a line item in here?

MR. LOHR: It's netted in there. Call coverage is about a million dollars a year.

MS. VOLPE: So that's part of the five million initial?

MR. LOHR: No.

MS. VOLPE: A million every year?

MR. LOHR: Right, which is included to come down to the net.

MS. VOLPE: But it's not a separate line here?

MR. LOHR: No.

MS. VOLPE: So where is it picked up in the cost structure?

MR. LOHR: I believe it's netted in the revenues.

MS. VOLPE: On your operating expenses, Dan, it doesn't appear anywhere?

MR. LOHR: No.

MR. COHEN: Can you identify what line it's on for everyone?

MR. LOHR: It would be in lines one through 13 read by payer.

MS. VOLPE: So the call coverage is in the operating revenue?

MR. LOHR: Um-hum.

MS. VOLPE: And can you explain to us how that works?

MR. LOHR: It's just a reduction of the revenue. We haven't finalized yet how to, in terms of billing for the services and the call coverage, that arrangement, so it's netted down, so it's properly excluded from operating results. It's just, for this

presentation, it's netted against the revenue.

MS. VOLPE: Okay, so, it's netted against the revenue. It's not built in as a cost. You're saying it would be an offset to revenue, because these providers, as they rotate through, would bill through Hartford Hospital?

MR. LOHR: Right now, that is the plan, yes.

MS. VOLPE: Okay and, so, it's not built in as a cost. What about the, in terms of building the program, since Backus doesn't have somebody with expertise now to build the program, there would be some cost associated with retaining individuals from Hartford to build out the program. Is that factored in anywhere?

MR. LOHR: Yes. There would be, I'm sure, director fees.

MS. VOLPE: Medical Director fees?

MR. LOHR: Medical Director fees.

MS. VOLPE: Right, and are those fees in here?

MR. LOHR: Yes.

MS. VOLPE: And where are those?

MR. LOHR: There's an estimate for those included in line three.

MS. VOLPE: Physician fees?

MR. LOHR: Yes.

MS. VOLPE: So that's for the -- so what's in that number for physician fees? It's not the call number. What is in that physician fee number?

MR. LOHR: It's directorships.

MS. VOLPE: Okay and, so, it's still being worked out. There's a chance that there could be additional cost within the system for implementing the service or are we pretty confident this is it?

MR. LOHR: At the moment, this is our best estimate. There could be additional cost. The cost may be less, depending on reimbursement arrangements on billing.

MS. VOLPE: Okay. Just one second. I just have to ask a finance question myself. We do have some follow-up questions for you, Dan, and some of these -- I think one you'll probably be able to do, and one you might need to redirect.

MR. LOHR: Okay.

MS. VOLPE: It is a financial question. So, based off of this pro forma, why are there no contractual write-offs in the gross revenue? Is the gross revenue really already met in this? We didn't see

any write-offs, no contractual write-offs.

MR. LOHR: Right. The way the model was built up, it was built on net reimbursement.

MS. VOLPE: Without any. Is it realistic not to have any contractual write-offs?

MR. LOHR: If you go from net revenue, you're in the same situation. The scale is balanced.

MS. VOLPE: Okay, so, I mean, Hartford HealthCare, you know, as a tertiary facility, I mean, their costs and rates are presumably higher than Backus, so what would the costs relative to the Backus rates be, because, usually, costs at a tertiary center are usually higher than they are at a community hospital, right?

MR. LOHR: I'm not sure I understand your question when you said costs and then rates.

MS. VOLPE: Well --

MR. LOHR: You're at two ends of the spectrum.

MS. VOLPE: Would Backus be getting the same -- like you didn't factor in any contractual write-offs for these services, so, presumably, you're saying it equals out, because you may not be collecting the revenue for the on-call doctors. They may be billing directly through the Hartford system, so the payers would be

paying rates not as they would at a community-based hospital for the service.

They presumably would be paying at a much higher rate at a tertiary facility, so, you know -- I mean is it fair to say that the payers would be paying more for these services at a community-based hospital than they would at --

MR. LOHR: Yeah. I would say that's not fair to say, principally because, for physician reimbursement, it's off of a fee schedule. It's Medicare fee schedules and Medicare fee schedule, generally.

MS. VOLPE: Right, sure, for Medicare, but for a commercial payer I mean.

MR. LOHR: Commercial payer pretty much the same thing. I mean they're pushing toward fee schedules.

MS. VOLPE: Okay, so, you think it would be the same fee schedule for a Backus interventionalist billing than a Hartford Hospital interventionalist billing?

MR. LOHR: I believe it would be.

MS. VOLPE: Okay. All right. Okay, I think we may be done. I just want to check one more thing for follow-up.

Thank you so much, Dan. We don't have any additional questions for you.

MR. LOHR: Okay.

MR. COHEN: If you're done with that witness, I just have a couple of Cross.

MS. VOLPE: Sure.

HEARING OFFICER HANSTED: I'll allow you to Redirect, yes.

MR. COHEN: Redirect. Sorry. Thank you.

HEARING OFFICER HANSTED: That's all right.

MR. COHEN: I got caught up. There were some questions earlier, Dan, about funding this from operations, funding the cost here. Can you comment on Backus's financial situation, profitability and the like?

MR. LOHR: Yes. For the last two fiscal years, I believe, as reported in one of the hearings, recently, Backus has had the highest operating margin percentage in the state, the last -- 16 percent, 14 percent.

The last couple of years, the operating margin, in terms of dollars, has been in the neighborhood of 40 million dollars.

MR. COHEN: So that 40 million dollars is

what?

MR. LOHR: The excess of revenue over expenses, operating margin.

MR. COHEN: So, in your opinion, expending I think you testified four and a half million dollars, and then, between 300,000 and 550,000 per year, can a hospital like Backus accommodate those costs easily?

MR. LOHR: I believe so, yes.

MR. COHEN: Thank you.

HEARING OFFICER HANSTED: Is that all?

MR. COHEN: Hold on just one second. Okay, thank you very much, Dan.

HEARING OFFICER HANSTED: Okay. This is probably a good breaking point. We're going to have to go into another day. We have to adjourn by 3:00 p.m.

Just a couple of housekeeping matters. The late file, Late File No. 1, I'll order that due by April 1st.

MR. COHEN: Okay.

HEARING OFFICER HANSTED: And with respect to the second hearing day, we will notify both the Applicant and the Intervenor.

I want to schedule for a date after we receive the transcript for this portion of the hearing,

just so we can reference back to this portion, if need be, and I won't put the court reporter on the spot, as to when that will be due, but we will notify you about the next hearing date.

MS. VOLPE: Thank you.

MR. COHEN: Thank you.

HEARING OFFICER HANSTED: Okay, so, with that, just before we adjourn, are there any members of the public, who want to comment on the proposal?

Okay, hearing none, I will adjourn until the next hearing date. Thank you, all, for coming.

MR. COHEN: Thank you.

MS. VOLPE: Thank you.

HEARING OFFICER HANSTED: You're welcome.

(Whereupon, the hearing adjourned at 2:52 p.m.)

Re: Docket No. 15-32031-CON – Excusal of David A. Whitehead and Bruce Cummings from June 14th Hearing

Dear Ms. Martone:

Hartford Hospital and The William W. Backus Hospital (the "Applicants") and the Intervenor hereby request that David A. Whitehead, Senior Vice President and Chief Strategy and Transformation Officer at Hartford Healthcare and Mr. Bruce Cummings, President and Chief Executive Officer at Lawrence + Memorial Hospital be excused from the continued public hearing in this matter on June 14, 2016. As you will recall, Mr. Whitehead and Mr. Cummings both filed Pre-Hearing Testimony in this matter and on March 23, 2016 entered direct testimony into the record. Additionally, after the first public hearing, Mr. Whitehead was appointed by the Governor to be a member of the Certificate of Need Task Force.

The attorneys for both parties agreed that these two senior executives would not be subject to cross-examination and their appearance at the continued hearing was not required. Therefore, the Applicants, in conjunction with the Intervenor, are requesting that Mr. Whitehead and Mr. Cummings be excused from attending the continued public hearing.

Very truly yours,

BROWN RUDNICK LLP

Re: Certificate of Need Application; Docket No. 15-32031
Establish and Operate a Primary and Elective Angioplasty Program at The William W. Backus Hospital

Dear Attorney Hansted:

This letter is in reference to the above captioned Certificate of Need ("CON") Application before the Connecticut Department of Public Health division of Office of Health Care Access. UMass Memorial Medical Center ("UMass") already provides primary and elective angioplasty to patients in the following towns listed in the CON Application: Putnam, Killingly, Thompson, Woodstock and northern Plainfield. UMass provides local access to primary and elective angioplasty services to Connecticut residents of our service area and we have been successful in that effort.

UMass and Day Kimball Hospital (Putnam, CT) have a long-standing, 10+ year relationship focused on ensuring timely access to angioplasty for residents in Day Kimball's service area. As the closest angioplasty provider, there is an established process to transfer STEMI or emergent patients who present at Day Kimball to UMass, and door-to-balloon times are consistently well below the recommended timeframe set forth in the latest clinical guidelines. Direct feedback from Day Kimball to UMass providers has been positive in each case, as well as in ongoing quality assurance reports. In addition, EMS serving northeastern Connecticut are accustomed to travel patterns to UMass that minimize time to device for STEMI patients. Our relationship with Day Kimball and local EMS is very strong. UMass has been providing education to Day Kimball emergency department staff and local EMS providers for years. The proposal put forth by Backus Hospital is detrimental to patients as it disrupts this streamlined access to care and established clinical partnership.

In fiscal year 2015, UMass provided 1428 total angioplasty procedures (approximately 360 STEMIs or emergent cases). Our primary and elective angioplasty program has the capacity to continue to serve the needs of the Connecticut residents and communities and we are not aware of any backlog of cases in our service area.

UMass supports Lawrence + Memorial Hospital in its opposition of the above captioned CON on the grounds that, among other reasons, (i) there is no public need for another primary and/or elective angioplasty program in the eastern Connecticut area; (ii) William W. Backus Hospital ("Backus") has not satisfactorily identified the population to be served; (iii) Backus has failed to comply with policies and standards adopted by the Office of Health Care Access; (iv) Backus has failed to comply with well-established clinical guidelines; (v) Backus has failed to comply with the Statewide Health Care Facilities and Services Plan; (vi) there is no lack of capacity and the services will result in duplicative services; (vii) the services will have a negative effect on quality, accessibility and cost effectiveness of healthcare services in the community; and (iix) the proposed services are not financially feasible and will negatively impact the financial strength of the health care system in Connecticut. UMass agrees on all counts.

It is UMass's position that the service area identified in Backus's CON Application is already well-served by a number of high-quality angioplasty providers, including our own. This being the case, we share Lawrence + Memorial's concerns that the establishment of more angioplasty services in the service area will further dilute volumes for existing providers and make it more difficult for hospitals like ours to maintain adequate volume.

We respectfully request that this letter be part of the official record.

Sincerely,

Jay Cyr, RN, MSN, MBA
Sr. Vice President, Surgical Services

DKH DAY KIMBALL HEALTHCARE

Community Health Needs Assessment Implementation Strategy

INTRODUCTION

Day Kimball Healthcare (DKH) is an independent, non-profit, integrated medical services provider with more than 1,200 employees including more than 300 associated physicians and other licensed independent providers. Our network is comprised of Day Kimball Hospital (The "Hospital") , Day Kimball Healthcare Centers in Danielson, Dayville, Plainfield, and Putnam, Day Kimball Medical Group, Day Kimball Home Care, Day Kimball Hospice & Palliative Care of Northeastern Connecticut ("Hospice"), and Day Kimball Home Makers ("HomeMakers").

On September 1, 1894 Day Kimball Hospital of Windham County opened its doors, the inspiration of two sisters, Miss Elizabeth and Gertrude Vinton, who had a vision for the "Windham County Infirmary. " Mrs. M. Day Kimball donated $5,000 for the construction of the infirmary building in memory of her recently deceased son, Day Kimball, with the condition that the institution be named after him. Other Kimball family members pledged an additional $4,000, and with the $9,000 total donations, Day Kimball Hospital was born.

In coordination with our affiliated healthcare centers, Day Kimball Hospital, a 104-bed acute care community hospital in Northeast Connecticut, offers acute and general medical/surgical care, a 24-hour emergency department, a birthing center, obstetrics and gynecology, pediatrics, hematology and oncology, cardiopulmonary, mental health programs and much more. Our highly-skilled physicians offer comprehensive services that integrate primary care medicine with specialties like emergency medicine, cardiology, neurology, women's health, cancer treatment, general surgery and more. For the over 90,000 members of our communities, we offer high-quality, comprehensive medical services delivered by skilled medical professionals close to home.

Of the total population in Northeast Connecticut, some 40,000 seek primary and specialty care, while approximately another 32,000 take advantage of DKH's inpatient, outpatient (ambulatory care), diagnostic and emergency services. (Note: approximately 26,500 of our medical group patients also use these services.)

Day Kimball Healthcare provides numerous programs to promote health and wellness, a variety of support groups, services and programs throughout the community to enhance the quality and accessibility of healthcare service.

BACKGROUND

In 2012 and 2013 Day Kimball Healthcare (DKH) participated in an eight-member consortium of Windham County Healthcare Providers that developed and funded a Community Health Needs Assessment (CHNA). The consortium members were Day Kimball Healthcare, Windham Hospital, Natchaug Hospital, Generations Family Health Center, United Services, VNA East and Northeast District Department of Health.

The primary goals of the community health needs assessment were to:

- Partner and collaborate with local healthcare providers
- Identify community health needs in Windham County
- Develop a blueprint for health and wellness programs in the community
- Assist with community benefit requirements.

The Windham County Consortium engaged The Center for Research and Public Policy (CRPP), an independent research firm to conduct a comprehensive assessment. CRPP conducted qualitative and quantitative research which utilized the following to identify and prioritize healthcare needs in Windham County:

- **Focus groups** (qualitative) – a total of 86 participants became involved in seven focus groups. The core composition of each group included: First Responders, Latinos, Community Leaders, School Based Health, Boomers, Faith Based and Youth.
- Comprehensive **Telephone surveys** (quantitative) – a total of 630 telephone surveys were conducted among residents of the 15 municipalities served.
- **State and Federal data**

Through this study, health needs were identified that are prevalent among residents across all socioeconomic groups, races and ethnicities, as well as health issues that highlight health disparities or disproportionately impact the medically underserved and uninsured.

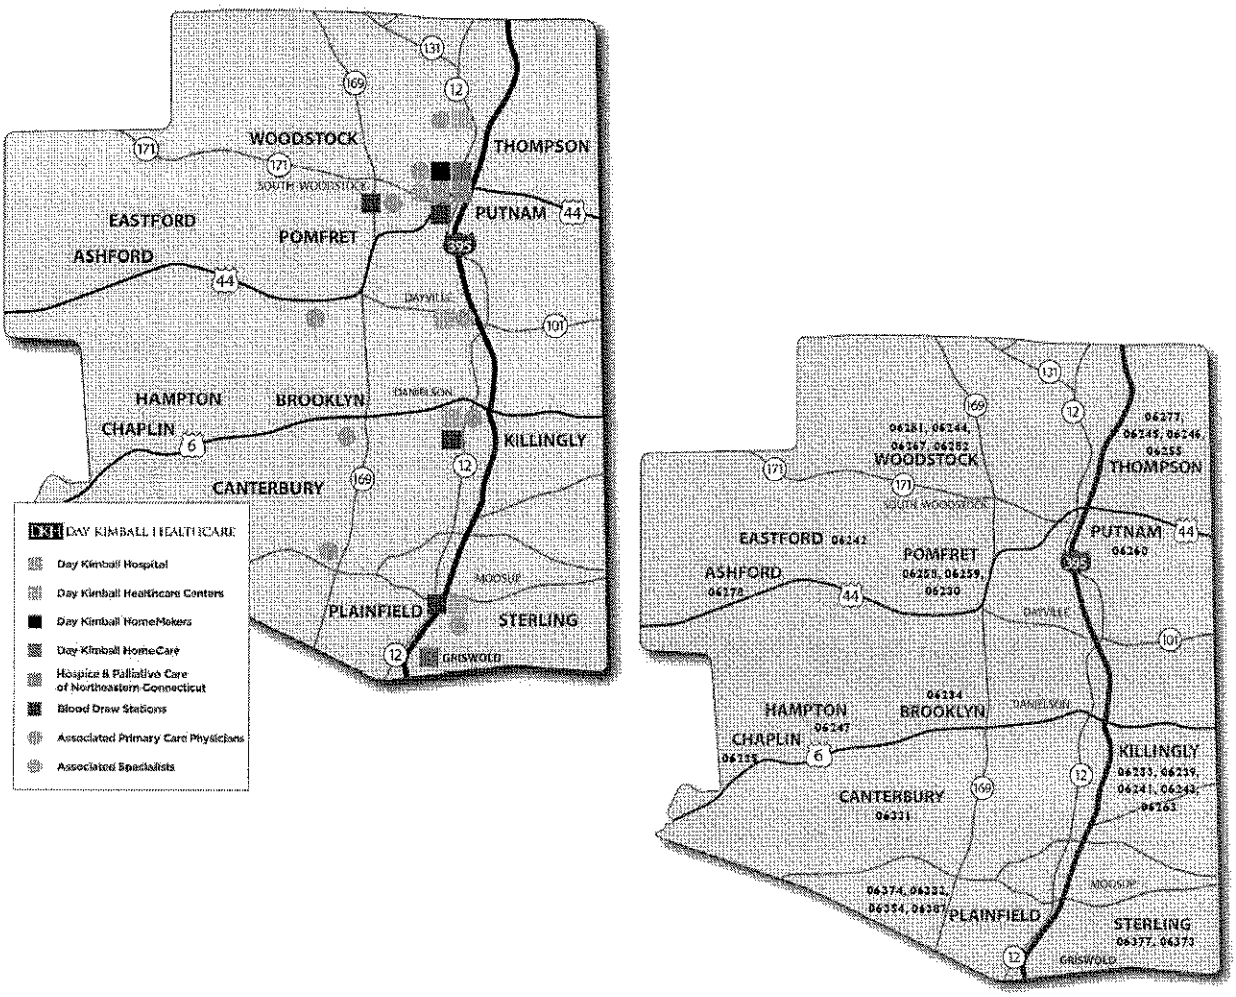
Major areas of healthcare needs include chronic disease, behavioral health and preventative healthcare. Specifically, Day Kimball Healthcare's priority areas include:

1. Cardiovascular Disease
2. Diabetes
3. Obesity
4. Breast Cancer
5. Depression/Suicide
6. Tobacco Cessation
7. Substance Abuse
8. Flu Shots
9. Child Abuse

SERVICE AREA

The population in Windham County ranges from long-term multi-generational families, to newly emigrated residents from urban areas. There is a wide range of socio-economic factors including very high income to poverty; advanced education to incomplete high school and home ownership to several towns where the majority of residents are renters. Windham County encompasses a rural area in the northeast corner of the state where 11.7 percent of residents live below the federal poverty level.

DKH's main service area is comprised of 13 of the 15 towns in Windham County with the primary area being in the Northeast corner of Connecticut. The maps below depict DKH's primary service area.



DKH's secondary service area extends south of Canterbury, Plainfield and Sterling in New London County and is comprised of Jewett City, Griswold, Hopeville, Pachaug, Lisbon, Glasgow and Voluntown.

STRATEGIES TO ADDRESS COMMUNITY HEALTH NEEDS

Day Kimball Healthcare (DKH) has used the qualitative and quantitative research data provided by CRPP to address the top nine healthcare priority areas. DKH continues to leverage direct delivery of service through our collaborations with such organizations as HealthQuest Northeastern Connecticut, The Northeast District Department of Health and Generations Family Health Center - FQHC, to meet the healthcare needs of the community. Below is a summary of the services and programs provided that directly address the healthcare priorities

Cardiovascular Disease/Stroke

There is a documented high incidence of heart disease in Northeastern Connecticut[1]. To combat this, DKH has developed a high-quality, comprehensive and coordinated program of cardiac care. As part of this "chain of survival", paramedics are trained to administer life-saving treatments before the patient even reaches the hospital. Also, DKH continues to work closely with UMASS for STEMI patient transfers via Life Star helicopter within 90 minutes of admission to the emergency department and meets regularly to review STEMI data.

DKH was designated as a Primary Stroke Center by the State of Connecticut Department of Public Health in March of 2012 and also, in December of 2014, received the Advanced Certification Primary Stroke Center designation from The Joint Commission. These designations were achieved by providing comprehensive care for all patients presenting with stroke symptoms including a complete administrative infrastructure supporting and guiding the process of stroke patients. In addition, clinical practice guidelines and policies were put in place, which reflect an interdisciplinary approach to care. Stroke education for staff, patients, families, the community and the EMS System are also executed regularly. Specific quality improvement initiatives are in place to provide ongoing assessment and evaluation for performance in caring for stroke patients.

In an effort to promote general cardiac wellness, the Day Kimball Nursing staff participates in many community health events focused on the geriatric community to provide education including nutrition and physical activity in addition to counseling regarding accessibility of services they may require.

Diabetes

DKH is proud to offer a diabetes management program as part of an enhanced coordinated care program facilitated through our Primary Care Practitioners to help adolescents and adults living with Type 1 or Type 2 diabetes, pre-diabetes, or gestational diabetes to manage their condition and maintain their health.

Specialized care plans are developed to provide patients with individualized treatment and medication management. Patients are provided with education and instruction about how to

[1] http://wwwn.cdc.gov/CommunityHealth/profile/currentprofile/CT/Windham/

perform diabetic self-care, including the importance of home blood glucose-testing, how nutrition and exercise impact diabetes, strategies for lifestyle modifications and much more.

Obesity

Recent studies have shown that obesity exacerbates schizophrenia and bipolar disorder, and that physical changes in the brain do occur as a result of this disease. It may be partially due to this link in co-morbidities, that Northeastern CT has such a volume of both of these types of patients.

General awareness about nutrition and health food choices is greatly lacking in the Northeastern CT region. Day Kimball Healthcare is working on combatting this by offering an overeaters anonymous program every Wednesday at 6:00 p.m. for support in recovery from compulsive over eating, binge eating and other eating disorders at the hospital. Also, the Day Kimball Nursing staff participates in many elementary school age health fairs where education is provided to the students and teachers about the importance of nutrition to help combat obesity from a young age.

Breast Cancer Awareness

Breast cancer is one of the most common types of cancer we observe in the population of Northeast Connecticut.

To better serve this population, DKH instituted a Breast Health Program in 2011, which has prospered over the last three years both in terms of helping our patients avoid long commutes for treatment and the quality improvements found within our treatment process.

At the inception of the Breast Health Program, time into treatment for a woman diagnosed with breast cancer was over 30 days, and approximately 20 percent of our population diagnosed with a breast cancer chose to seek treatment at distant facilities for a variety of reasons. DKH heard the concerns of our community and launched the Breast Health Program complete with a full time Nurse Navigator to improve our ability to serve local women diagnosed with breast cancer.

The Breast Health Program diagnoses about 50 cases of breast cancer per year from the 8,000 mammograms performed at DKH. Thanks to the program, a patient diagnosed with breast cancer will now experience a smoother, more efficient transition into her first treatment. In 2013 DKH exceeded the 30 day national standard of care for "time to first treatment" and came in at 25 days. In the last three years, DKH has augmented its staff of cancer care professionals to facilitate the delivery of efficient, high quality cancer care.

DKH has a disproportionately high number of women who are Asian-American coming in with higher stage breast cancers, and that many of our higher stage breast cancers are from the state of CT defined under-served towns of Putnam, Plainfield and Danielson.

In response to this observation, DKH has made a concerted effort to reach out to the Asian-American community by contacting employers and local community groups with literature

translated into Asian languages and an Asian-American Registered Nurse in an attempt to engage the communities in discussions and navigation into screening services.

DKH oncology staff was present for approximately 18 hours in the community doing breast cancer awareness/education programs in Plainfield in July and August of 2015. A total of 37 women received verbal and written education and information regarding breast cancer screenings from this outreach program.

Depression / Suicide

In 2014, DKH Outpatient Behavioral Health Clinic treated approximately 550 cases of depression and other forms of mental illness in patients between the ages of 17-80. Depression is a serious medical illness with mood, cognitive, and physical symptoms and is associated with higher rates of chronic disease, increased health care utilization, and impaired functioning. DKH recognizes that all aspects of health are interrelated, and we understand the importance of caring for the whole person.

Day Kimball Healthcare's behavioral health services help address these unhealthy days providing care to people of all ages to address a wide range of behavioral and psychiatric conditions through a caring and comprehensive approach that's integrated with the rest of the patients' medical care. As part of our Day Kimball Healthcare's integrated care approach, our Behavioral Health team also communicates with the primary care practitioners to ensure best possible care of both mind and body.

Day Kimball Healthcare's adult outpatient behavioral health care provides diagnostic evaluations, individual, family and group therapies, medication management, and follow-up treatment for a wide variety of behavioral and psychiatric conditions. Our compassionate team of psychiatrists, psychotherapists, Advanced Practice Registered Nurses (APRNs), social workers, and professional counselors work together to offer a comprehensive array of services and a variety of specialized treatments. Our providers also specialize in serving the needs of specific populations including the elderly, women and the LGBT community.

Tobacco Cessation

Windham County had the highest smoking rates for both men (16.9 percent) and women (14.4 percent) in 2012[2]. At 15.6 percent, Windham was the only county with an overall smoking rate above the national average[3].

Strategy:

- Offer smoking cessation groups
- Maintain smoke-free campuses at all Day Kimball Healthcare sites
- Advertise community education programs offered in the Shopper's Guide, Turnpike Buyer, Villager and Reminder newspapers as well as through social media.

[2] http://vizhub.healthdata.org/us-health-map/
[3] http://www.countyhealthrankings.org/app/connecticut/2015/measure/factors/9/description

- Host and/or participate in community education programs
- Participate in ongoing education conversations on radio station WINY 1350 AM
- Provide Nicoderm patches for inpatients
- Education at high school wellness fairs to discourage smoking/encourage cessation

Substance Abuse

Northeast Communities Against Substance Abuse (NECASA), working with DCF and the State Police trained the Killingly School system and the Brooklyn School system in Drug Endangered Children's issues. Also, the Governor's Bill on Prescription Drug Abuse mandates training for physicians that prescribe opioids. This bill was signed in July 2015[4].

Studies done by The Eastern Regional Mental Health Board for 2015 showed a pressing need for more general public education about substance use issues, including problem substances, risk factors, warning signs, etc.[5] Participants in the focus groups voiced significant concern about the growing problems with heroin addiction and overdose in the local community. In addition, several mayors and selectmen in the DKH area have specifically identified heroin as a top concern within their communities.

In addition, Day Kimball Healthcare uses a validated screening tool approved by the Center for Medicare/Medicaid Services (CMS). This Audit-C tool (used by the Veteran's Administration) is performed on all eligible behavioral health inpatients. It consists of asking questions about the frequency and number of alcoholic drinks that they consume as well as the estimated number of times in the past year that they have consumed six or more drinks in one occasion. The information abstracted from these screenings is reported to CMS as well as The Joint Commission (TJC). This data is instrumental in the tracking alcohol abuse and binge drinking statistics for our region.

Flu Shots

Influenza is a highly contagious and serious illness. To help protect its patients and their families and their healthcare workers and their families, DKH offers annual influenza vaccines. It is strongly recommended that all Day Kimball Healthcare staff and volunteers, whether they have direct or indirect patient contact, including employees, private physicians, contracted and vendor personnel, volunteers and students receive annual influenza vaccination at no cost. Refusal of the flu vaccine means following the hospital policy of properly wearing a hospital approved mask while at work in any portion of the healthcare system, including patient homes, wherein patients are intended to be examined, treated or otherwise engaged during the influenza season. Vaccines are also provided at various work sites on all shifts to accommodate a broad spectrum of employees.

Day Kimball Healthcare (DKH) is not only committed to providing a safe environment for patients and healthcare workers (HCW), but also for the members of our service community.

[4] http://www.necasaonline.org/Customer-Content/WWW/News/PDFs/Priorities_Report_2015_updated_version_.docx

[5] http://www.changingmindsct.org/uploads/5/8/0/4/58045789/priorities_report_2015_updated_version.pdf

Day Kimball Healthcare hosts influenza immunization clinics with increased staffing at a variety of different locations throughout the Northeast Connecticut community during the flu season, as well as consistent participation in several community health fairs each year and hosting an annual influenza and pneumonia program helping to provide immunizations to the members of the Northeastern Connecticut community.

Child Abuse

According to recent numbers compiled by Connecticut's Child Advocacy Centers in 2013[6], Windham County had, by far, the highest incidence of child sexual abuse per capita in the state. Children who live, learn, grow and play in Windham County are at a higher risk for being sexually abused before they reach adulthood than children in other areas of the state. In fact, more than 3000 reports are placed annually to Department of Children and Families.

In order to address this staggering statistic, in 2013 Day Kimball Healthcare began an initiative of education and community outreach for employees. Day Kimball has chosen a nationally-recognized, evidence-based training curriculum provided by Darkness to Light and is called Stewards of Children, Child Abuse Prevention. Darkness to Light's mission is to empower people to prevent child sexual abuse.

The Stewards of Children program raises awareness of the prevalence and consequences of child sexual abuse. This is done by educating adults about the steps they can take to prevent, recognize and react responsibly to the reality of child sexual abuse. Day Kimball's senior management identified five key departments comprised of 400 employees who would have the most exposure to children and where the training would have the most impact. This training goes above and beyond normal training requirements and directly impacts our community. Day Kimball is providing this training to its employees at no cost. The short-term goal, utilizing two internal trainers, was to train those 400 employees by June of 2014 with a long-term goal of having all employees trained by 2018. This would make Day Kimball a partner in prevention with Darkness to Light.

It is Day Kimball's hope that this program will empower community members to identify the early signs of child abuse and respond appropriately thus reducing Windham County's per capita rate. We have already seen positive results from attendees as was evident when a member went to her school system to clarify policies and procedures around this topic. This rippling effect is exactly the outcome we wish to achieve.

They are: Day Kimball Medical Group's pediatrics and OB/GYN practice groups, which see more than 9,500 children and 6,500 women respectively; the maternal child health team at Day Kimball Hospital which delivers about 600 babies annually; the inpatient and outpatient care teams for adolescent behavioral health services which engages 260 teens each year; and the hospital's emergency department which sees almost 30,000 patients each year of which 3,900 are under the age of 18 years old. There are 400 employees who represent the care teams for these

[6] http://www.d2l.org/site/Connecticut.htm

areas of patient services. Day Kimball's goal is to orient these clinicians and allied providers to child abuse, what it is, how to prevent it and how to stop it.

The greater impact comes when it is considered that approximately 428 people were trained, of which approximately 350 live in northeast Connecticut, will easily touch more than half of the 92,000 residents of the region. The level of awareness and education about child abuse that this group can deliver to the friends and family served through Day Kimball Healthcare is staggering – in a good way. The program will have immediate impact on this issue that greatly influences the health and wellbeing of every person within the abused child's sphere of life. Plus it's an impact that goes beyond statistics – it will literally change the culture of northeast Connecticut by teaching our community how to break the barriers that cause child abuse.

Tobacco Cessation

- Number attending Smoking Cessation Programs
- NCQA Quality Measures – smoker screening and smoking cessation counseling

Substance Abuse

- CMS/TJC 'Alcohol Use Screening' Measure on qualified Behavioral Health inpatients
- Beginning 1/1/2016: CMS/TJC Sub Measure 2 – 'Alcohol Use Brief Intervention Offered/Provided' for the same population.

Flu Shots

- DKH employee vaccination rates
- Number of flu shots administered in community clinics
- Number of flu shots ordered and dispensed to Day Kimball Medical Group practices

Child Abuse

- DKH mandated 'Darkness to Light' employee training sessions
- CT Child Advocacy Center reporting measures

SUMMARY

Based on an overview of Day Kimball Healthcare's progress in these nine community health need areas, and the success of various programs, the biggest challenges now and in the coming years will be in the areas of behavioral health, smoking cessation, substance and child abuse.

DKH will continue to assess and address the health needs within our community through partnerships with local healthcare organizations. There is also potential for broader offerings of education leveraging the resources and expertise of our newest partnership with Hartford Health Care

In addition, a 2018 community health needs assessment report will update the information herein as outlined by the IRS guidelines.

Hi Barbara,

I sent the attached out separately from Exhibit W, the administrative notice. How do you want to add it to the table?

Thanks.

June 9, 2016

Bimal Patel, President

The William W. Backus Hospital

326 Washington Street,

Norwich, Connecticut, 06360

Dear Mr. Patel,

Please accept this letter of support for the development of a Primary and Elective Percutaneous Cardiac Intervention (PCI) program at The William W. Backus Hospital.

Although I am not a healthcare expert, I do know that timing is everything when it comes to a cardiac emergency, and residents in my community deserve to have timely access to PCI.

From what I understand, residents of this region are currently unable to access a PCI-capable facility within a 30-minute drive time. This lack of access should not exist– our families, friends and neighbors should not be at a disadvantage when it comes to their health, just because of where they live.

Having this service available at Backus Hospital would improve quality of life, make our region a more attractive place to live and, most importantly, save lives.

Please accept this letter of support – Backus should be applauded for its commitment to offering Percutaneous Cardiac Intervention, close to home for patients.

Sincerely,

Richard L. Matters

Testimony in support of Docket No. 15-32031-CON
CT Department of Public Health,
47- Capitol Avenue, Room C, Hartford, CT
June 16, 2016 9 a.m.

We the undersigned would like to offer our strong support for the Backus Hospital request for the Establishment of a Primary and Elective PCI Program at The William W. Backus Hospital (Docket No. 15-32031-CON).

On behalf of our constituents we want to support Backus Hospital's proposal to establish a primary and elective angioplasty program. Many residents in our districts who suffer from heart attack symptoms currently must travel more than 30 minutes to receive care, which is not fair when you take into account that every second counts in these situations.

Just because we are part of a rural region in Eastern Connecticut does not mean that we should not have access to life saving care like most other residents in the state of Connecticut do. In addition to the rural nature of this region, there are also economic and geographic barriers that many of our residents face.

Many of the towns in our districts are designated as either "Health Professional Shortage Areas" or "Medically Underserved Areas." It is also an area at a higher risk for coronary artery disease due to an older population that is more prone to risk factors including age, obesity, diabetes and smoking rates.

Research shows that the sooner patients suffering from heart attack symptoms receive treatment, the better. If Backus offered angioplasty services, it would likely improve outcomes and quality of life for residents and most importantly, save lives.

We urge you to approve the proposal to offer angioplasty services at Backus so that residents of this region have convenient and timely access to these lifesaving services, close to home, in their own community.

The current lack of access should not exist – our families, friends and neighbors should not be at a disadvantage when it comes to their health just because they live in northern New London or Windham counties.

Sincerely,

Representative Paul Brycki

HARTFORD, CONNECTICUT

POST REPORTING SERVICE
HAMDEN, CT (800) 262-4102

. . .Continued verbatim proceedings of a hearing before the State of Connecticut, Office of the Attorney General, Office of Health Care Access, in the matter of Hartford Hospital and The William W. Backus Hospital, Establishment of a Primary and Elective PCI Program at The William W. Backus Hospital, held at the Department of Public Health, 470 Capitol Avenue, Hartford, Connecticut, on June 14, 2016 at 9:00 a.m. . . .

HEARING OFFICER KEVIN HANSTED: Okay, we're going to get started here. Welcome back, everyone. This is a continuation of a hearing held on March 23, 2016 regarding Docket No. 15-32031, pertaining to an application filed by Hartford Hospital and The William Backus Hospital for the establishment of a primary and elective PCI program at The William Backus Hospital.

At this time, I would ask all those individuals, who are going to testify, to please stand, raise your right hand, and be sworn in by the court reporter.

(Whereupon, the parties were duly sworn

in.)

HEARING OFFICER HANSTED: Okay, thank you, all. Just before we get started, if you could pass around the microphone and just identify yourselves for the record, those folks, who were just sworn in, one at a time? Thank you.

MR. SHANE FOREMAN: Shane Foreman.

MS. JANETTE EDWARDS: Janette Edwards.

DR. JOHN FOLEY: John Foley.

DR. PAUL THOMPSON: Paul Thompson

DR. FRANCIS KIERNAN: Francis Kiernan.

DR. KYLE McCLAINE: Kyle McClaine.

MS. MARY ANN CARNA: Mary Ann Carna.

MR. DANIEL LORER: Dan Lorer.

MS. REBECCA DURHAM: Rebecca Durham.

MR. STUART MARKOWITZ: Stuart Markowitz.

MR. BIMAL PATEL: Bimal Patel.

MS. SHRADDHA PATEL: Shraddha Patel.

DR. BRIAN CAMBI: Brian Cambi.

MR. SETH VanESSENDFELT: Seth VanEssendfelt.

DR. DANIEL RISSI: Daniel Rissi.

HEARING OFFICER HANSTED: Okay, thank you, everyone. And, according to my records, we left off with

Mr. Lorer on the stand. He was being Cross-Examined, and I understand there's some clarification that needs to be done by Attorney Cohen, so, if you want to proceed in that manner, you may do so.

MR. DOUG COHEN: Okay. Mr. Hansted, if we could have elected representatives go first, and then we'll move to Mr. Lorer, if that's okay.

HEARING OFFICER HANSTED: That's fine. I didn't know if you wanted to do the clarification first.

MR. COHEN: Yeah, and we have a letter that we would like to provide for the record now. We have copies for everyone.

HEARING OFFICER HANSTED: Okay.

MR. COHEN: Thank you.

MR. KEVIN RYAN: Good morning, Mr. Hansted. I'm Kevin Ryan, the State Representative for the 139th District. I am here representing the Norwich area legislators, which include Paul Brycki, Emmett Riley, Linda Orange, Doug Dubitsky, as well as Senator Catherine Osten, and I am here to provide testimony to the docket number you've mentioned.

We offer strong support for the Backus Hospital request for the establishment of a primary and elective PCI program at the William W. Backus Hospital.

On behalf of our constituents, we want to support Backus Hospital's proposal to establish a primary and elective angioplasty program. Many residents in our districts, who suffer from heart attack symptoms, currently must travel more than 30 minutes to receive care, which isn't fair, when you take into account that every second counts in these situations.

Just because we're part of a rural region in Eastern Connecticut does not mean that we should not have access to life-saving care, like most other residents of the state of Connecticut.

In addition to the rural nature of this region, there are also economic and geographic barriers that many of our residents face.

Many of our towns are in districts that are designated either health professional shortage areas or medically underserved areas.

It is also an area at a higher risk for coronary artery disease, due to an older population that is more prone to risk factors, including age, obesity, diabetes and smoking rates.

Research shows that the sooner patients suffering from heart attack symptoms receive treatment the better. If Backus offered angioplasty services, it

would likely improve outcomes and the quality of life for residents and, most importantly, save lives.

We urge you to approve the proposal to offer angioplasty services at Backus, so that the residents of the region have convenient and timely access to these life-saving services close to home in their own community.

The current lack of access should not exist on families, friends and neighbors, should not be at a disadvantage when it comes to their health, just because they live in Northern New London or Windham Counties. Thank you for your time.

HEARING OFFICER HANSTED: Thank you, sir, and we will add the letter to the record.

MR. COHEN: We also filed some additional documents yesterday afternoon. I see that you have them. I just want to make sure. They were two separate letters of support. I think it was 2:00 or 3:00 they were filed. Okay, great. Thank you.

HEARING OFFICER HANSTED: Those are exhibits marked as Z on the Table of the Record.

MR. COHEN: Thank you. Mr. Hansted, as we discussed, we have one clarification from Mr. Lorer that we'd like to discuss now. I do have other questions for

him, but I thought, if Ms. Volpe would want to Cross him on this question, that we do that first.

HEARING OFFICER HANSTED: That's fine. You may proceed.

MR. COHEN: Thank you. Good morning, Dan.

MR. LORER: Good morning.

MR. COHEN: Can you clarify your answer regarding physicians' call coverage? You indicated that the physician call coverage is not a separate line item, but it's netted out in revenues. Can you please explain that?

COURT REPORTER: Please grab a microphone.

HEARING OFFICER HANSTED: Everyone, please remember, if you're going to speak, just grab the microphone. I understand it's a little difficult passing these around, but please be conscientious of that.

MR. LORER: Sure. My name is Dan Lorer. At the last hearing, I misspoke in response to the question on where the physician on-call compensation is recorded.

It is included on line B-1, which is salaries and wages, so the numbers don't change from the exhibit. I misspoke by indicating they were netted against the revenues.

HEARING OFFICER HANSTED: Thank you. Attorney Volpe, do you have any Cross?

MS. MICHELE VOLPE: No, I don't have any further questions for Mr. Lorer.

HEARING OFFICER HANSTED: Thank you.

MR. COHEN: Before we get into some Redirect of these witnesses, there's a couple of administrative matters that we'd like to discuss with you. The first is the UMass letter that we received yesterday, and the UMass letter raises significant issues that none of them are new, but I think we'd like to have our witnesses have an opportunity on Redirect to address those, some of the points in that letter.

HEARING OFFICER HANSTED: You may do that. I don't have an issue with that. Understand that, obviously, UMass isn't here to be examined on those questions.

MR. COHEN: Sure.

HEARING OFFICER HANSTED: Attorney Volpe, do you have any issue with that?

MS. VOLPE: Well I mean only to the extent that it's responsive to our testimony. I mean that's what's subject to Cross and Redirect. I mean no new evidence can be offered at this time in the proceedings.

HEARING OFFICER HANSTED: Right. Right, so, Attorney Cohen, like Attorney Volpe just stated, as long as it's relevant to their testimony, I'm okay with it, however, as I stated, UMass is not here to be Cross-Examined or even questioned directly, so I'd like to have UMass here to question them, so I don't want to get into a situation, where we're left having you make statements or your witnesses are making statements that can't be verified by UMass.

MR. COHEN: Well that's actually the problem with accepting a letter like this. UMass has made statements throughout this letter that are inaccurate, incorrect, misleading, and they're not here to -- we're not able to Cross-Examine them on this letter.

If we can't discuss this letter, whether or not it was raised in the Cross-Examination, then we're going to object to it as extremely prejudicial.

This letter raises a significant number of things, as I said, that we have -- that are incorrect. The record is replete with them.

We've been transparent in how we presented our application today. This letter, as I mentioned, has some misleading and incorrect information.

For example, Backus would be the closest --

MS. VOLPE: He's offering Direct testimony. Now I would object. The letter was presented for the record. I mean we're not here -- you offered letters from the First Selectman of Sterling and Franklin, and we don't have an opportunity to talk to them about their statements in the letter either, which may not be accurate, so I think it's been submitted, it's added to the record.

It's no different than any other letter of support, so we would object with Attorney Cohen offering any additional testimony on the letter.

HEARING OFFICER HANSTED: Attorney Cohen, I'm going to sustain that objection. The letter from UMass was received by my office on June 2nd. We didn't receive any objection from your office until just right now.

The letter is part of the record. We'll give it due weight, if it's due any weight at all, but I'm not going to allow you to offer any evidence to contradict that letter.

MR. COHEN: Okay.

COURT REPORTER: Can I go off the record

for one second?

HEARING OFFICER HANSTED: Sure.

(Off the record)

COURT REPORTER: Okay, I'm all set.

HEARING OFFICER HANSTED: Okay, we're back on the record. Is this picking up okay now?

COURT REPORTER: Yup.

HEARING OFFICER HANSTED: Okay. Attorney Cohen, you may proceed.

MR. COHEN: Yes. One more administrative matter. The late-filed exhibit that we filed, I have some Direct questions for our witness on that. I don't know when you'd like to do that; at the end of this hearing, at the beginning.

HEARING OFFICER HANSTED: Is that Exhibit Z, the late file? No, that's a supplemental support letter.

MR. COHEN: The Late File 1 that we filed I guess it was a week or two after the hearing. June 1st. April 1st. I'm sorry, right. April 1st.

HEARING OFFICER HANSTED: Okay. Just for the record, that's Exhibit S on the Table of the Record. You may question your witness now on that, if you want to proceed in that manner.

MR. COHEN: All right, well, since Mr. Lorer is here, if I can just spend two minutes Redirecting him on a couple of issues to clarify the record?

HEARING OFFICER HANSTED: Sure.

MR. COHEN: So, Dan, you indicated that you're the Regional V.P. of Finance. Is this position responsible for Backus Hospital?

MR. LORER: Yes, it is.

MR. COHEN: Just to clarify your answer from Ms. Volpe's Cross-Examination, can you tell us what the capital cost of the PCI program will be at Backus and the annual loss for the program?

MR. LORER: As I mentioned in the previous hearing, the capital cost for the program at this point our estimate is between four and a half million dollars and five million dollars of capital investment.

The annual loss begins in a projection of just under $400,000, and, in year five, it goes up to about $705,000.

MR. COHEN: Okay, thank you. Do hospitals ever operate a program or a service at a loss?

MR. LORER: Yes, we do.

MR. COHEN: And why is that?

MR. LORER: Community, service community commitment.

MR. COHEN: And is Backus in a financial position to absorb that loss?

MR. LORER: Yes, we believe we are.

MR. COHEN: Thank you.

HEARING OFFICER HANSTED: Attorney Volpe, do you have any Cross?

MS. VOLPE: I have no questions.

HEARING OFFICER HANSTED: Okay.

MR. COHEN: This is regarding the late-filed exhibit. I wanted to just ask a couple of Direct questions. Did you prepare the exhibit, Mr. Foreman, or was it prepared under your direction?

MR. FOREMAN: Yes, it was prepared under my direction.

MR. COHEN: And do you have any clarifications or corrections to the late-filed exhibit?

MR. FOREMAN: I do have one clarification. On the second page of the late file, page 1551, in point number three, I'd just like to clarify that 14 of the 38 zip codes, which is 37 percent of the zip codes and 22.3 percent of the population, have an out-of-state provider as the closest PCI provider by drive time, so we did not

specify drive time, so 11 of those zip codes are outside of the 30-minute drive time.

MR. COHEN: Okay. I just want to clarify briefly. How is this exhibit different from that which was provided in the CON and the completeness responses?

MR. FOREMAN: So our original assessment included Backus Hospital as a potential PCI provider, and it also assumed that leaving the state of Connecticut was not optimal, so we did not include out-of-state, and then we also utilized Maptitude as the planning tool in the original assessment.

Within the late file that you have, we used only existing PCI providers, and we included out-of-state providers, and we used Google maps. Since the Intervenors had used Google maps, we thought it would aid you in making an apples-to-apples comparison.

MR. COHEN: Thank you. So looking at the late-filed exhibit, which breaks down to who has access to PCI services, can you summarize your findings?

MR. FOREMAN: Sure. Interestingly, the late file completely confirms and validates our original assessment, so when we think about the late file and what you have before you, the things that haven't changed is the angioplasty regions made up of the 38 zip codes that

we previously discussed.

The 38 zip codes aggregate into 26 towns. In 2015, from a total population perspective, there were 231,419 residents within the angioplasty region.

When we looked at incidents of disease, acute MI is still up within the same region.

MS. VOLPE: I'm going to object to that --

HEARING OFFICER HANSTED: Are you picking her up?

MS. VOLPE: I can speak up. I'm going to object, because now --

HEARING OFFICER HANSTED: Hold on, Attorney Volpe.

COURT REPORTER: It's not working?

HEARING OFFICER HANSTED: No.

COURT REPORTER: Okay. Let me go off the record for a second.

HEARING OFFICER HANSTED: Wait. Now it's back. Okay. Attorney Volpe, do you need a microphone?

MS. VOLPE: I'll project my voice.

HEARING OFFICER HANSTED: Well I just want to make sure the court reporter --

MS. VOLPE: Can you get me? I'll talk over this way. I'll speak this way, but don't think I'm

not directing my question. I'm objecting to Mr. Foreman's remarks, because I think the late file speaks for itself, and it's specific to numbers, so he's going on to talk about disease in the region, which is not part of the late file, so I'm objecting. This is an opportunity for Redirect on submission.

MR. COHEN: This is Direct Examination of our witness, and I'm going through the late file and highlighting various issues that we think you, as the Hearing Officer, need to take a look at, so I think it's perfectly fine.

We gave a lot of leeway on their testimony, whether it was far a field or not. The idea here is to try to get facts. Nothing that Mr. Foreman is saying is inaccurate. It is facts related to this late-filed exhibit.

MS. VOLPE: Attorney Cohen had his opportunity to get in the facts, and the reason the late file was required was because they were deficient in the submission of their facts.

I think the late file speaks for itself. We don't have any questions on the late file.

HEARING OFFICER HANSTED: I'm going to allow the testimony, Attorney Volpe. I will allow you

Cross-Examination on what he's testifying to at this point.

MR. COHEN: Go ahead.

MR. FOREMAN: Thank you. So, as I mentioned, acute MI within the region specified in the late file is up about 12.6 percent over a six-year period.

When we looked at incidence of disease specifically stemming within the late file region, it's above both state and national rates, and when we looked at primary and elective PCI preferred treatment for these patients, primary PCI in the region is 18 percent below the state and eight percent below the nation in total, and, in elective PCI, it's actually more significant.

It's 19 percent below state and 41 percent below what we would expect across the U.S., so an elective PCI, when you compare that patient population to the remainder of the nation, they get the preferred treatment 41 percent less often than we would expect.

For all 38 of the zip codes within the late file, Backus Hospital would be the closest PCI provider.

L & M treats very few of these patients today, so when we look at the region and look at the

patients that L & M is treating out of this region, they have about a three percent inpatient market share, and then, when we look at PCI, specifically, they treated 12 patients out of this region in 2013, 22 in 2014, 32 in 2015, and just eight in the first two quarters of 2016.

When we look at who is the dominant market leader within the L & M region, it's actually Yale-New Haven Hospital at 51 percent.

So let's talk about what did change within the late file. So the demonstrated need actually went up. When we did our original assessment and we used Maptitude and were conservative in our estimate, we estimated 146,000 people didn't have proper access to PCI within the 30-minute drive time, and when we looked at this using their strategic planning tool, that number actually grew to 160,230 people, so over 160,000, based on the late file, do not have access to PCI services within the 30-minute drive time.

And then, finally, an additional, just over 18,000 people from that region, are actually forced to go out-of-state for care, as well.

MR. COHEN: Thank you, Mr. Foreman. No further questions at this time.

HEARING OFFICER HANSTED: Attorney Volpe,

do you have any Cross?

MS. VOLPE: I don't have any questions for Mr. Foreman.

HEARING OFFICER HANSTED: Thank you.

MR. COHEN: Thank you. I'd like to proceed with questions for Dr. McClaine. These are Redirect questions.

MS. VOLPE: I'm going to object. You had an opportunity to Redirect at the time I Crossed the witness. Now is not an opportunity to Redirect.

MR. COHEN: That's absolutely not true. There was no opportunity to Redirect. When you look at the record, the only folks that we had an opportunity to Redirect were Mr. Lorer and Mr. Foreman, and I will not ask any Redirect questions of those two individuals.

There's absolutely nothing in the record that reflects an opportunity to Redirect the rest of my witnesses. I've gone through the record, through the transcript with a fine-tooth comb, and there's absolutely --

MS. VOLPE: -- because you didn't ask a question. You didn't ask. You didn't present them on Redirect.

MR. COHEN: We --

MS. VOLPE: Excuse me. Hearing Officer Hansted gave us an opportunity to Redirect every time a witness was up there. You did not choose to Redirect.

MR. COHEN: If I can address that, there were specific instances, where you asked do you have any Redirect questions, and, as I said, it was only with regard to two individuals --

MS. VOLPE: And --

MR. COHEN: If I could finish, please? Mr. Foreman and Mr. Lorer. I specifically said with regard to both of those that I had no further questions.

The questions that Ms. Volpe asked were all over the board. She was not done with any of our witnesses, so we did not discern that she was done at any particular point in time, so I have a series of Redirect questions for several of our witnesses, primarily of the docs, and then we have some Redirect questions on some of the other issues, but we never had an opportunity to Redirect these witnesses.

HEARING OFFICER HANSTED: Okay, counsel, let me just stop you there, both of you. At the end of the day, what we really want out of these hearings is information. I don’t want to get bogged down on technicalities, as to who had an opportunity to Redirect

and who didn't and when that was done and when it was not done, so I'm going to allow the Redirect.

Again, Attorney Volpe, I will allow you to Cross again, if need be.

MS. VOLPE: Right, and I appreciate that, Hearing Officer Hansted. I just want to make it clear that the Applicant isn't going to be offering new testimony and new information. It has to be specific to what was directed to the witness, because it's not your responsibility to ask him every time whether he wants to Redirect.

He has to take the initiative after the witness has spoke, right then, when we have the facts before us, as to whether or not he wanted to Redirect, and he chose not to, so I understand your position, and it is a fact finding, and we want to have all the facts, but I want to make it clear that we're going to look at the testimony, we're going to see if it was a question presented that requires clarification, and I'm going to object if it's new information that was not in a question that we presented.

HEARING OFFICER HANSTED: Attorney Cohen, how many questions do you have for the doctor?

MR. COHEN: For Dr. McClaine, probably

around five or six.

HEARING OFFICER HANSTED: Okay. We're going to go off the record. I want you to review those questions with Attorney Volpe. I want you to come up with an agreement, as to which questions you both agree should be asked and what shouldn't be asked, and then we'll go back on the record and discuss those.

MR. COHEN: Okay.

MS. VOLPE: Thank you.

(Off the record)

HEARING OFFICER HANSTED: Can everyone hear me okay in the back of the room? Okay. We are back on the record, and, Attorney Cohen, if you want to proceed?

MR. COHEN: Thank you. We have with us Dr. Foley and Dr. Thompson, and I'm going to address several of the questions first to Dr. Foley.

Dr. Foley, do the demographics support your contention that the angioplasty region is a sicker population?

DR. FOLEY: It's nice to be back without a fever this time, so I'm not infectious, for the record, but, yes, I believe the demographics both numerically in the application support the contention that we are going

to be servicing well over 100,000 people, who don't have 30-minute access now.

I can tell you, also, anecdotally, from both living and working in the community, that our patients are sicker. Our application goes through that, in spite of the fact that there are more patients, who are having STEMIs, that there are less people having access to cath labs, so when you have more of a disease and less of care, you have to ask yourself why that happens, and our contention is it's access, and, so, I do believe that -- and it's hard for us to understand, because for many people, who live and work in Hartford, or New Haven, or areas where there are ready access, you just think that everybody has that access, but the patients that I deal with, and now we're out in the Putnam area, don't have access to this.

They don't have it, they don't feel like they have it, and this application I think is there's going to be life-saving therapy to a lot of people, who don't feel like that they have access to it now.

MR. COHEN: Thank you.

HEARING OFFICER HANSTED: Attorney Volpe, do you have any follow-up?

MS. VOLPE: Just let me confer.

HEARING OFFICER HANSTED: Okay. One moment. Do you need a microphone over on that end?

MS. VOLPE: We may.

HEARING OFFICER HANSTED: Okay.

MS. VOLPE: Okay, so, if we could direct them to page 59 of the application, the bates stamp? This is our pre-file on 59, along with your submission, which starts on page 133, the Community Health Needs Assessment for the Eastern Region.

MR. COHEN: Fifty-nine of?

MS. VOLPE: Of our pre-file.

MR. COHEN: Of the pre-file?

MS. VOLPE: And page 133, which is your Eastern Region Community Health Needs Assessment. So, Dr. Foley, do you have that in front of you?

HEARING OFFICER HANSTED: Just give him one moment.

MR. COHEN: Hold on. Are we having Redirect of Dr. Foley, or are we having their witness testify?

HEARING OFFICER HANSTED: No. We'll Redirect question-by-question.

MR. COHEN: Okay.

MS. VOLPE: It's specific to Dr. Foley's

statement, that this population is sicker in the state than other areas of the state, so it's specific to address that point that he made.

HEARING OFFICER HANSTED: Attorney Cohen, can you just hand the doctor your microphone?

MR. COHEN: Yeah, I just handed him -- oh, the microphone, yes.

HEARING OFFICER HANSTED: I apologize for the microphone situation. It's a little bit cumbersome.

DR. FOLEY: In the interest to give you I think an answer to the question, I would like to defer it to Janette, who understands the specifics of the detail.

I mean, when you look at the percentage of obesity rates and smoking, I know they're higher. When you look at the mortality rate in this population group, the mortality is higher, and that was shown, in terms of the heart disease mortality. It's 167.5 deaths per 100,000 for Windham County versus 153.4 for Connecticut, so their mortality rate is higher.

MS. VOLPE: All right, but now we're talking about mortality, and we were directing it specific to your statement, that this population is sicker than the rest of Connecticut and the U.S.

You know what? In the interest of moving

this proceeding along, we were going to have Dr. Foley look at the chart with the data that was extracted from their application, with a legend that shows where in the region they're better than Connecticut in the U.S. average, where they're similar, and where they're in a small percentage are worse, but, in the interest of time, we'll let Attorney Cohen ask his next question.

HEARING OFFICER HANSTED: Hold on. One at a time. You need a microphone.

MR. COHEN: I would ask you that you caution Ms. Volpe not to testify, which she just did. If she wants to ask a question, that's okay, but characterizing this as small numbers or whatever, I think that that's inappropriate.

She did that in the first hearing, and we didn't object to it, but given where we are today, I'd ask that she ask questions and not testify.

HEARING OFFICER HANSTED: Yeah. Let's just, for both sides, keep in mind that I don't want the attorneys testifying, and with respect to page 59 of the Intervenor's pre-file, you know, the document speaks for itself, and I think the doctor just testified, as to what he believes, so let's let that stand.

I mean we have enough in the record at

this point, so if you're okay with that, let's --

MS. VOLPE: I am, thank you.

HEARING OFFICER HANSTED: Thank you. Okay, Attorney Cohen, do you have another question?

MR. COHEN: If you can pass the mike back over? The next question is do you expect L & M's service area elective PCI referral patterns to change if Backus has a PCI program?

DR. FOLEY: No, I don't, and when you look at Backus Hospital, the group that I'm with, Hartford Medical Group, refers now to Hartford Hospital. We have a group in town that I used to be a member of that is Yale Medical Group cardiology service, and I would anticipate that their referrals to Lawrence will remain the same.

We hope, however, to provide a cath lab that they can practice in, and for the patients, who are local, who can avail themselves of transportation to Lawrence, we hope that they're an active part of our cath lab and able to take care of their patients, but I don't believe in any significant way their referral patterns will change, because doctors make the decisions, as to where they refer patients, not hospitals or systems.

HEARING OFFICER HANSTED: Attorney Volpe,

do you have any follow-up?

DR. CAMBI: I'm a little uncomfortable with how the hearing is being organized, but I'm happy to respond to that. John is a friend and a colleague. I respectfully disagree with that assertion.

I think that, if Backus were to get approval for an elective PCI program, naturally that will, unfortunately, erode some of the volume that comes to L & M.

If patients now see that this hospital has a program there, they're more likely to stay at that hospital, which will potentially pull volume from L & M.

I don't know that either one of us can prove that. We can anticipate what happens in the future, but, certainly, I see that as happening.

HEARING OFFICER HANSTED: Okay. Doctor, a fair point. I was just going to ask both doctors isn't it both speculation, I'm sorry, speculation on both your parts, as to how this would affect either program?

To me, there's no hard evidence in the record, and I don't know how you would come up with that evidence. I mean is that fair to say, that it's speculation?

DR. CAMBI: In terms of proving it

scientifically, yes. I mean, anecdotally, certainly there are large numbers of patients, now that there's a program at L & M, who previously got their intervention at Yale, who were doing it at L & M, so there's been some loss there.

I would expect a similar phenomenon to happen if Backus were to get a program, which would obviously harm L & M, in terms of volumes, finances and quality, but we can get into that later, but, in essence, you're right. I can't prove it to you scientifically.

HEARING OFFICER HANSTED: Right. Right.

DR. FOLEY: I would agree. I mean it's conjecture, based on the way I practice, and the fact that I know who from the Backus area are going to Lawrence now and who isn't, and I honestly can't see a significant change in the non-STEMI population group after we get a cath lab.

HEARING OFFICER HANSTED: Okay, so, let's move on from this subject.

MR. COHEN: We have a couple of questions for Dr. Thompson. Can you please explain exactly how the programs at Backus and Hartford will be integrated and how that relates to providing a standard of care for patients?

MS. VOLPE: I --

HEARING OFFICER HANSTED: Hold on. I want to hear the answer to this question, Attorney Volpe.

DR. THOMPSON: So I'm the physician co-Director of the Hartford HealthCare Heart and Vascular Institute, and Backus is part of Hartford HealthCare, so their cardiology group falls under our Cardiovascular Institute.

We're going to review and going to operate with the Backus cath lab as an extension of the Hartford Hospital cath lab, so the direct overall supervision will be provided of that cath lab, that interventional program, by Francis Kiernan, who is the Director of the cath lab at Hartford Hospital, again, the idea being that this is part of Hartford HealthCare Cardiovascular Institute. Backus is part of Hartford HealthCare Cardiovascular Institute, so the direct oversight of that program, the overall oversight will be by Fran Kiernan.

Now there will be a person on the ground. There will be a local Director, but in terms of morbidity and mortality conferences, quality control, all that sort of stuff, staffing, will be on the same model as Hartford HealthCare.

Now integrated, as well, and integrated in

making sure that, for example, relatively new interveners or operators in that lab, interventionalists in that lab will be supervised, as necessary, to their level of expertise, and we're going to do that both by allowing them to perform procedures at Hartford Hospital, so that their volumes are kept up, and, also, by using their simulation center.

We have a simulation center with a $200,000 module that simulates catheterizations. No, it does not replace clinical care, but it does facilitate the training.

This is not something that's totally novel to us, because we did help establish the Backus diagnostic cath lab in the first place, and that was done with oversight from Fran Kiernan, and, also, we've helped establish the Hospital of Central Connecticut oversight, so the take home message is that the Backus cath lab will be part of the Hartford HealthCare Heart and Vascular Institute and will be an extension of the cardiac catheterization lab at Hartford Hospital.

MR. COHEN: Thank you.

HEARING OFFICER HANSTED: Thank you. Attorney Volpe, do you have any follow-up?

DR. CAMBI: Hearing Officer Hansted, you

can reject me, but you made a comment that appealed to me before. You said this hearing is in the interest of finding facts and understanding the situation to the best of our ability.

It just occurred to me while they were talking that there is a significant way volume will be impacted at L & M if Backus were to get an elective program.

MR. COHEN: I want to object.

HEARING OFFICER HANSTED: Wait, wait, wait, wait, wait, wait. Microphone.

MR. COHEN: This is not the question that he's answering. If he wants to answer that question, Dr. Thompson testified regarding the integration of the Hartford --

HEARING OFFICER HANSTED: Okay. Attorney Volpe, do you have any follow-up on what Dr. Thompson just testified to?

MS. VOLPE: Regarding integration of the program?

HEARING OFFICER HANSTED: Yes.

MS. VOLPE: He didn't offer anything new. That's already in the application.

HEARING OFFICER HANSTED: Okay. Attorney

Cohen, I'd like you to give the doctor the microphone back, because I want to hear what he has to add to the previous question.

DR. CAMBI: Sometimes it's hard to think on the spot, and I was just reflecting on your question about volume loss.

At L & M, part of the elective volume, the non-STEMI volume, are on inpatients, patients, who come to the ER with chest pain, not having a heart attack, but chest pain, right? They get admitted to the hospital, and they have an abnormal stress test, they get an angiogram, and we identify a partial blockage that requires a stent. That's an elective case.

Well if those patients go to Backus and they now have a program, it doesn't matter who their doctor is. Insurance companies won't pay for them to be transferred to a hospital 10 minutes away if that service is already offered at the initial presenting hospital, and, so, you see, if patients are presenting near Backus and they have a chest pain syndrome and they go to Backus Hospital, whereas now they might come to L & M, we're going to lose that volume of elective cases, and I don't think John would disagree with that. That's fairly certain.

HEARING OFFICER HANSTED: Okay. Just a follow-up to that.

DR. CAMBI: Yeah.

HEARING OFFICER HANSTED: Is that true with any insurance plan?

DR. CAMBI: As far as I know, and, you know, I'm not an expert in --

HEARING OFFICER HANSTED: Right. Obviously, in your experience.

DR. CAMBI: In my experience, that we often run up against that. If the current level of service is offered at a treating hospital, insurances will not pay for the patient to go to another hospital for the same level of care, just because they want to, or because it's a patient preference, or because it's a doc preference.

HEARING OFFICER HANSTED: Okay, now, is that true in any situation, or just a situation, where the elective angioplasty is needed on a more short-term basis in the initial diagnosis?

DR. CAMBI: Correct. So that's why I didn't think of it at first. So there are multiple scenarios, in which people arrive at an elective PCI. One is where they come in as an outpatient, and maybe

they have some symptoms that are stable and a blockage is identified. While there, they can be sent wherever, okay?

The other scenario is, when they're admitted to the hospital with something that's not a heart attack, but something a little more urgent than a stable coronary disease as an outpatient, it's in that cohort, and that runs the spectrum from non-ST elevation MI to unstable angina to stable coronary disease.

There are patients in that spectrum that require admission to a hospital and get an elective PCI that I think are the biggest cohort that we stand to lose at L & M.

HEARING OFFICER HANSTED: Okay. Attorney Cohen, do you want to have someone follow-up on that?

MR. COHEN: Yeah. That leads to a lot of questions of Dr. Cambi. How many patients present at Backus today from the, I mean at L & M today from the Backus angioplasty area for non-STEMIs?

DR. CAMBI: I have no idea.

MR. COHEN: You'll be pleased to know that we have an idea, and we're going to address that.

HEARING OFFICER HANSTED: If you could just identify yourself for the record?

MS. EDWARDS: Sure. My name is Janette Edwards. We presented in our application that L & M today only holds three percent of the inpatient market share in the angioplasty region, as we've defined it for ourselves, and looking at L & M data that they submitted to OHCA as part of their agreed settlement for their elective PCI CON, year-to-date of 2016 there's been only four elective cases that have presented at L & M from the angioplasty region, and, in 2015, there were only four inpatient elective cases and six outpatient elective cases, so, in our estimation, patients today from the angioplasty region are not utilizing Lawrence & Memorial Hospital for these services, and any impact that our program would have would be immaterial.

HEARING OFFICER HANSTED: Okay. I think we've had sufficient testimony on this subject. Let's move along.

MR. COHEN: I believe you may have touched on this, but just to complete the thought, can you clarify the training that the staff would have, the Backus PCI staff would have?

DR. THOMPSON: So there are two groups that are being trained. One is the physicians, obviously. We're going to recruit people, who are

capable of doing that, but they'll be overseen in their performance by Fran Kiernan and his group. In other words, experienced operators would be overseeing less experienced operators, should we recruit, less experienced operators.

The second part of that is training the staff. Because we're an institute, one of the goals of an institute is have the same care throughout, because there's a rule in medicine that variance in care often means less quality care, so we'll have people trained both in our lab and, also, using the simulation center to nurses, techs, etcetera, to do everything the same way, so they'll be training both in live and, also, in simulation to make sure that we use the same standards of care throughout the system, and that, again, is using our, you know, $10 million training center that's used by many groups, including the Navy, and the Army, etcetera, etcetera. People come in to use our training center.

HEARING OFFICER HANSTED: Thank you. Attorney Volpe, nothing? Thank you.

MR. COHEN: Okay. At this point -- thank you, Drs. Foley and Thompson. At this point, we'd like Becky Durham to come up. I'm trying to limit the questions for you.

Ms. Durham, the Intervenors have stated that the Applicants ignored the 2014 SCAI ACC/AHA expert consensus document update on PCI without on-site surgical backup. Can you clarify the Applicant's use of the 2011 and '14 guidelines?

MS. DURHAM: Yes, I can. Becky Durham, for the record. We actually included both the 2011 and 2014 guidelines in our CON. Exhibit 1 was the 2014 guidelines. Exhibit 9, the 2011 guidelines.

We chose to use the 2011 guidelines for percutaneous coronary intervention in our figure four of the application, where we discuss some of the operational pieces of the program, and that is because it was the broader heart of the guidelines from 2011 versus the update in 2014.

The big thing about the guidelines that I want to make sure people understand is that, when the application goes in, that's a stagnant point in time. These guidelines come out every few years, and as we are part of the Heart and Vascular Institute with Hartford HealthCare, we have to look at these guideline as they come out and ensure, whenever you're building a program or continuing a high-quality program like at Hartford Hospital, that we're looking at the most up-to-date

guidelines as they come out, so, in 2016/'17, new guidelines can come out that we've got to ensure that we're utilizing for the best outcomes of our patients, and that's what we will be doing.

MR. COHEN: If I could follow-up, because it's directly related to this, and then we can --

HEARING OFFICER HANSTED: I'll allow that.

MR. COHEN: Okay, thank you. Comparing the 2011 and 2014 guidelines, can you briefly tell us how the application complies with both sets of guidelines?

MS. VOLPE: I'm going to object to that.

HEARING OFFICER HANSTED: Well, Attorney Volpe, I'm going to allow that, because I -- before you answer that question, it was my understanding that the 2014 guidelines would replace the 2011 guidelines. Is that not true?

MS. DURHAM: Correct. My personal opinion, and I think my colleagues would agree, is it doesn't replace, because it's very specific. The 2014 is without surgical backup, where the 2011 guidelines is guidelines for percutaneous intervention overall, so, you know, if you have a surgery, a site with surgery, that is not included.

HEARING OFFICER HANSTED: Right.

MS. DURHAM: So this is a more broader guideline.

HEARING OFFICER HANSTED: Okay, so, the 2014 update was only an update, as to specific subjects?

MS. DURHAM: Without on-site surgery.

HEARING OFFICER HANSTED: Without on-site.

MS. DURHAM: Correct.

HEARING OFFICER HANSTED: Okay, so, the 2011 guidelines still hold true for the with on-site?

MS. DURHAM: Correct. It does, yes. And I can go through very quickly, if you'd like to hear.

HEARING OFFICER HANSTED: No. As long as I know, generally speaking, that the 2011 still have some validity, that's fine with me.

MS. DURHAM: Correct.

HEARING OFFICER HANSTED: Okay, thank you.

MR. COHEN: And just to clarify, Mr. Hansted, the 2011 guidelines even have validity for a program like Backus, so there are aspects of that 2011 guidance that weren't addressed by the 2014 update.

HEARING OFFICER HANSTED: Okay. Attorney Volpe, did you have something?

MS. VOLPE: Well I think we do want to address that, because we have the 2011 guidelines and the

2014. I mean it has a reference to on-site surgical hospitals without on-site surgical backup and recommendations for 2011, which have changed.

HEARING OFFICER HANSTED: Okay. I want to hear that, because I want to know which guidelines are actually in effect at this moment in time. We just need a microphone for you, Doctor. Attorney Cohen, if you could give him the microphone?

MR. COHEN: Well if we wanted to have Becky Durham talk about the 2011 and ’14 guidelines?

HEARING OFFICER HANSTED: Well let me -- I want to hear from this doctor first.

DR. CAMBI: It’s my understanding the 2011 guideline, I agree with Becky, is a guidelines for percutaneous coronary intervention PCI, making no distinction in the title about on-site or off-site.

The 2014 updated guideline is specifically addressing PCI without on-site surgical backup, however, there is lots of information here in the 2011 guideline that specifically focuses on PCI in hospitals without on-site surgical backup, therefore, this document, anything this document speaks on --

HEARING OFFICER HANSTED: That document being the 2014 guidelines?

DR. CAMBI: ’14. Would trump or replace sections in this document that speak to PCI in centers without on-site surgical backup. Does that make sense?

HEARING OFFICER HANSTED: Right, and I believe she agreed with that.

DR. CAMBI: Okay.

MS. DURHAM: And I would just say, as I said earlier, as guidelines change, we have to adapt to those, so it’s not that we’re going to build a program on the 2011 guidelines. We’re going to say, in 2016, did a more focused update come? Those are the guidelines that we have to look at to ensure we’re having the best patient outcomes. Guidelines are a fluid process compared to an application, you know, that goes in at one point in time.

HEARING OFFICER HANSTED: Right, right, so I think we’re all on the same page. She’s just talking about what they would rely upon.

My general question was what would anybody rely upon, and I think we have --

MS. DURHAM: The most up-to-date guidelines.

HEARING OFFICER HANSTED: Right.

MS. DURHAM: Absolutely.

HEARING OFFICER HANSTED: Okay. All right, thank you, all.

MR. COHEN: Okay, thank you. Now we're going to have Dr. Kiernan come up and answer a couple of questions.

Thank you, Dr. Kiernan. There's been a lot said at the last hearing regarding 120 and 90-minute guidelines. As the Director of the Hartford Hospital cardiac lab, as an interventional cardiologist, can you please clarify for us what each of those standards are and what they apply to?

DR. KIERNAN: Certainly. My name is Francis Kiernan. The guidelines are actually performance measures. The guidelines have evolved over the years. Initially, for example, it was felt that if PCI could be performed for someone with an acute myocardial infarction, it should be performed within 120 minutes at a PCI-capable center.

As for the issue, that if you treated the patient with myocardial infarction earlier, they had better outcomes, and we hear the term throughout this hearing of time being muscle, but, more important, time equates to survival.

The highest risk period for someone with

acute myocardial infarction is early. Many people unfortunately pass away before they even get to the hospital. People, who are lucky enough to get to a hospital, have a much higher chance of survival.

The performance measure for patients, who present to a PCI-capable center, were adjusted, so that the hospital should be able to perform this procedure within 90 minutes of arrival at the door.

Now it was further recognized over the years that treating an acute myocardial infarction is not just a hospital-based effort. It really starts with EMS.

In the American Heart Association, American College of Cardiology, they’re referred to systems of care, and the systems of care bring the EMS system into the picture, so now we look at a concept of first medical contact. That is, when EMS first arrives on the scene, the expectation is that a PCI-capable center should be able to perform PCI within 90 minutes of that first medical contact.

Now what happens to a patient, who presents to a hospital without that PCI capability? Well, obviously, a decision has to be made. Now the decision tree consists of the two options.

One is to transfer the patient to a center

that can perform PCI. It's thought that that's reasonable if that process can be done within 120 minutes. The other option is to give a clot-busting drug, such as tPA.

Now why not just give tPA? Well many studies have shown that PCI for acute MI has a benefit over tPA, and that's a survival benefit, so it's more important to give this life-saving therapy, if possible, but it's only going to work if it's done quickly, and that's the reason for the development of these guidelines, which are really performance measures.

MR. COHEN: Thank you.

HEARING OFFICER HANSTED: Attorney Volpe, do you have anything?

MS. VOLPE: I'll ask the doctor --

DR. CAMBI: I guess I would just say that I completely agree with everything he said, except that the only thing I would suggest to the panel is that these guidelines are created and designed by a panel of experts, much like Dr. Kiernan, himself, after pouring over reams of scientific study and literature, to come up with a framework to help guide places like us in our situation on how best to allocate resources and deliver ideal standards of care.

And, so, as he points out, when a patient presents in an area without a PCI center, a decision needs to be made, and those decisions involve making a choice. If it's going to take me longer than 120 minutes to get this patient to a PCI-capable center and get that artery open, scientific evidence would suggest that that patient does better receiving thrombolytics.

In the Applicant's case, it takes them typically in this situation greater than 120 minutes to get that patient to a PCI-capable center. No thrombolytics were ever administered there, and patients weren't routinely sent to the nearest capable PCI center, which is L & M, so I agree with Dr. Kiernan on his point on how we think about guidelines and how they are designed to help us frame practice standards in our region.

HEARING OFFICER HANSTED: Okay. I just have one question for you, Doctor. So the 120 minutes, that's the time they need to get the patient to the hospital and to complete the procedure?

DR. KIERNAN: No. The 120-minute guideline refers to a patient, who presents to a hospital without PCI capabilities.

The 30 minutes additional time is the

transfer time, theoretically, so you'd make a decision, the patient presents at a non-PCI hospital, as to whether or not you can get them to a center that can perform the PCI within 120 minutes from first medical contact.

HEARING OFFICER HANSTED: Right, so, including the travel time?

DR. KIERNAN: It includes the travel time, absolutely.

HEARING OFFICER HANSTED: Okay. Right, so, the travel time really is, what we're looking at here, is the 30 minutes, because it's 90 minutes for the procedure?

DR. KIERNAN: Well yes and no. For example, if a patient arrives within, you know, 30 minutes of first medical contact to a non-PCI hospital, well then you have an additional 90 minutes to get them to a place to get the door open. You can't the vessel open theoretically. Now the earlier you do that, the better it is.

HEARING OFFICER HANSTED: Right. Okay, thank you.

MR. COHEN: Okay, thank you. Dr. Kiernan, will 100 percent of the PCIs performed at Hartford Hospital from the Backus angioplasty region shift to

Backus?

DR. KIERNAN: My expectation would be that they wouldn't, because, at a hospital without surgical backup on site, one would not want to do relatively high-risk procedures that require special equipment, such as atherectomy catheters, left ventricular support catheters, etcetera, because it just wouldn't be safe to do that.

So I think we were relatively conservative in our application by saying that I believe about 40 percent of the patients, who would be candidates for non-myocardial infarction angioplasty at Backus, would likely be transferred to a place that can offer a higher level of care that is with surgical backup.

MR. COHEN: Thank you.

MS. VOLPE: So, if I may, on page 1466 of your application, this is in your completeness questions on page 1466, the Applicant -- can you tell us what -- your testimony is directly contrary to what you submitted in your application. I'm asking the doctor the question.

HEARING OFFICER HANSTED: That was page 1466 of the application?

MS. VOLPE: Yeah. The completeness questions that OHCA presented asked for projected

angioplasty region, PCI volume shift to Backus, and, under the Hartford Hospital category, they put 100 percent would shift to Backus from Hartford in the region.

MR. COHEN: Janette Edwards would be the best person to answer this question.

HEARING OFFICER HANSTED: Well I'd like to have the doctor just clarify that, because it was his statement, so if he could clarify?

DR. KIERNAN: My understanding was that I honestly did not participate in the development of this, this graph that you're looking at, but I think that was a worst case scenario, but, from a medical perspective and as the potential future Medical Director of this laboratory, I can say that certainly 100 percent of the procedures would not be done.

I believe Ms. Edwards has some information on page 490 that 40 percent of cases were backed out on that particular.

MS. VOLPE: Okay, but this is an important point, because their testimony here today directly impacts their projections on volume.

MR. COHEN: Actually, I think Janette Edwards would be the best person to talk about this.

HEARING OFFICER HANSTED: Okay. Let's have Ms. Edwards address that.

MS. EDWARDS: So the chart on page 1446 actually is answering a different question than the way Attorney Volpe is framing it, so, on page 490 of our application, where we outline the potential Backus elective and total PCI volume projections, we clearly back out 40 percent of NSTEMI or potential elective volume, due to their complexity, understanding that those cases would still be better suited to be performed in a tertiary care location. On page --

HEARING OFFICER HANSTED: Let me just stop you there.

MS. EDWARDS: Sure.

HEARING OFFICER HANSTED: Is that the percent complex elective PCI?

MS. EDWARDS: Correct.

HEARING OFFICER HANSTED: 39.5 percent?

MS. EDWARDS: Yes.

HEARING OFFICER HANSTED: Okay. I see that is backed out.

MS. EDWARDS: We took 39.5 percent of that potential, our projected 486 potential cases, actually, so what we termed non-complex elective PCI originating

from the service area is 295.

HEARING OFFICER HANSTED: Okay and that's the 40 percent that the doctor just testified to?

MS. EDWARDS: Correct.

HEARING OFFICER HANSTED: Okay. I follow that.

MS. EDWARDS: So on the incompleteness questions, the question OHCA asked us was how the proposal will not result in a shift in volumes from existing providers and how there will be no impact on existing providers, and, due to the way we approached our projections, we wanted to try to get at this information in the most conservative and accurate way possible.

So the chart on page 1466 actually outlines a worst case scenario, illustrating to OHCA that even if, and I stress the word "if," 100 percent of the volume seen at Hartford Hospital originating from the Backus angioplasty region were to shift to Backus Hospital, there would be no impact in volume or compromising of the Hartford Hospital program.

Below that, what we did was we applied a 36 percent inpatient market share to all of the other volume originating from the angioplasty region to come up with the projected PCI volume shift to Backus, and you'll

note that, in total, we're only six cases off from our original projection, so it was just a different methodology to try to answer OHCA's question.

HEARING OFFICER HANSTED: Okay.

DR. CAMBI: That helps clarify the discrepancy. My only remaining comment --

MS. JESSICA SCHAEFFER-HELMECKI: Excuse me. Can I just follow-up quickly with one question while we're on the topic, just to clarify?

Why did we use the 36 percent for the market share shift?

MS. EDWARDS: So we used 36 percent, because, when you look at Backus Hospital alone, we did not look at Hartford HealthCare in totality, we really looked just at Backus Hospital for this market, Backus Hospital overall captures 36 percent of the inpatient market share for the total angioplasty region, as we've defined it, so those 38 zip codes, our inpatient market share at Backus is about 36 percent.

MS. SCHAEFFER-HELMECKI: Okay. The inpatient market share, not just specific to the angioplasty?

MS. EDWARDS: That is correct. As a way to try to project what we might actually have as a

potential impact, we used our inpatient market share.

MS. SCHAEFFER-HELMECKI: Okay, thank you.

MS. VOLPE: But that's to a different service area, though. Their inpatient 30 percent is to a different service area than angioplasty?

MS. EDWARDS: Correct.

HEARING OFFICER HANSTED: She stated that. We understand that.

DR. CAMBI: Thanks, again, for the clarification. I may be reading this wrong, as well, but it looks like the volume projections, based on the charts and graphs, are all shifts from existing providers.

I'm not making the connection on how this ties into unmet need.

MS. EDWARDS: Is that a question for me?

HEARING OFFICER HANSTED: Well, no, he can't question you. He's not an attorney.

MS. EDWARDS: That's what I thought.

HEARING OFFICER HANSTED: With all due respect, Doctor. If Attorney Volpe would like to question her, she may. She needs the microphone back. I know you hesitated, Attorney Cohen.

MR. COHEN: I did.

DR. CAMBI: Sorry.

HEARING OFFICER HANSTED: That's okay.

MS. VOLPE: So all of the volume projected is shown as a shift from existing providers, as opposed to an unmet need?

MS. EDWARDS: No. So, again, this question is answering a very specific -- the answer is answering a very specific question, as outlined by OHCA. What we have illustrated in our application is that patients from this region are suffering from NSTEMI and STEMI at a higher rate than the state or the nation, yet are receiving this intervention at a lower rate than the state or the nation, so, in our estimation, there's probably between 50 to 52 cases that are just not being served today.

MS. VOLPE: Okay, you've answered the question. Thank you. We do have a follow-up question for Dr. Kiernan.

HEARING OFFICER HANSTED: I just want her to be able to finish her statement in full.

MS. EDWARDS: And what I'd just like to point out is that, right now, the region that we've illustrated as our angioplasty region has 230,000 people, who are not receiving care in the same way, as you can see by our map.

They’re not receiving the same standard of care as the majority of the rest of our state, and, right now, according to our late file, there are 160,000 people, who have no access to this care within 30 minutes of a drive time.

So, in our estimation, yes, there’s 50 to 52 cases that are not being serviced right now in our service area, and the remaining individuals, who require this intervention, are forced to either leave the state or travel great distances to receive care.

HEARING OFFICER HANSTED: Thank you. Attorney Volpe, you had a question for the doctor?

MS. VOLPE: Dr. Kiernan, is it your position that the patients in the angioplasty region none of them can receive care within 120 minutes? I mean that is the national standard, correct?

DR. KIERNAN: That’s the national standard for a patient, who is transferred to another facility, and, obviously, it would depend upon, you know, the transportation system to get people to various hospitals, so, certainly, people within that region can receive care within 120 minutes.

MS. VOLPE: Right, so, they can receive care within 120 minutes, and that is -- excuse me. So

your statement is they can receive care within 120 minutes, and that is the national standard?

HEARING OFFICER HANSTED: That's what he testified to.

MS. VOLPE: Yes, thank you. I have no further questions.

MR. COHEN: Dr. Kiernan, along those lines, is getting someone into a cath lab and the vessel opened within 90 minutes better than 120 minutes?

DR. KIERNAN: I believe I testified to that previously. The earlier the angioplasty performed the better the outcomes, in terms of not only morbidity, but, also, mortality, so if you could have the procedure within 30 minutes, the expected outcomes would be even better.

MS. VOLPE: So, Dr. Kiernan, I think everyone would agree with that statement, that, you know, you need to open up the heart sooner, so then I would ask you why would someone presented to Backus are they not transferred to L & M, which is only 17 miles away, 21 minutes?

DR. KIERNAN: I would defer that question to the physicians at Backus, since I don't practice there.

MS. VOLPE: Okay.

HEARING OFFICER HANSTED: Do you want to have someone else testify?

MS. VOLPE: If you practiced at Backus, would you refer them to a closer facility?

HEARING OFFICER HANSTED: Well, Attorney Volpe, I'm not going to have him answer that question. That's pure speculation. He testified that he doesn't practice there.

MS. VOLPE: But he's going to be overseeing the program.

HEARING OFFICER HANSTED: I understand that, but there is no program yet, so if a doctor, who currently works at Backus, wants to testify, as to that question, then I'm happy to hear that, but not this particular doctor.

Attorney Cohen, do you want to present someone else to answer that question?

MR. COHEN: I have another question.

HEARING OFFICER HANSTED: Wait, wait, wait. We're still on Attorney Volpe's.

MS. VOLPE: I don't need that question answered. I think it was answered already.

HEARING OFFICER HANSTED: Okay. All

right, thank you.

MR. COHEN: Okay, thank you. Dr. Kiernan, can you address the issue of 50-plus minutes to activate the Backus cath lab that was discussed at the prior hearing?

DR. KIERNAN: Again, I think there was a little bit of misunderstanding there, in the sense that I believe the application presented a worst case scenario for activation of the cath lab.

We would certainly strive to employ a system, much like we use at Hartford Hospital, where we use pre-hospital ACGs to activate the cath lab while a patient is being transported to the hospital.

The cath lab staff is also en route to the hospital and often times ready to treat the patient within a few minutes of arrival, rather than 50 minutes of arrival.

In Hartford, we have a lab set up and prepared. A table is prepared, covered and ready to go, and we use the ER staff to help transport the patient to the laboratory and get the patient setup, so that we can perform the procedure quickly, and my expectation is that we would use that same system at Backus Hospital, much like we do at Hartford Hospital and as we do at our other

hospital in the system that provides emergency angioplasty at HOCC.

MR. COHEN: Thank you.

MS. VOLPE: We don't have any questions.

MR. COHEN: Okay. This is the last question for you, Dr. Kiernan. Did you consider the 2014 SCAI ACC/AHA expert consensus document and its statement, quote, "Multiple low volume and partial service PCI centers within a geographic area increase costs to the overall health system and have not been shown to improve access," and that, quote, "The development of PCI facilities within a 30-minute emergency transfer time to an established facility is, therefore, strongly discouraged," closed quote, in the context of this application?

DR. KIERNAN: Again, I think we have to understand the guidelines and, as Dr. Cambi said, our guidelines. They're the recommendations for best practice, however, the guidelines specifically have a statement that indicates that programs that are geographically isolated are exempt from this particular requirement.

I think, as other members of our team have testified, there are -- that this region is somewhat

geographically isolated, with approximately 160,000 people, who would be within a 30-minute drive time of this center, and, you know, another several thousand people that, you know, would be within a few minutes more than the 30-minute recommendation.

MS. SCHAEFFER-HELMECKI: So with regards to that geographically isolation standard, it says 30 minutes not from the town, correct? It's 30 minutes to the other facility, so even if a town is more than 30 minutes away, or a patient is more than 30 minutes away, the standard looks at hospital-to-hospital, correct?

DR. KIERNAN: The 120 minutes refers to a hospital-to-hospital transfer.

MS. SCHAEFFER-HELMECKI: Oh, excuse me. Not the 120 minutes. The 30 minutes, as to whether or not it's geographically isolated.

DR. KIERNAN: That's the expectation, that you should be able to get to a hospital within 30 minutes of being picked up by EMS.

MS. SCHAEFFER-HELMECKI: Well it defines geographic isolation to exist if the emergency transport time to another facility is 30 minutes or more, so L & M is 21 minutes, I believe? (Multiple conversations)

DR. KIERNAN: We're suggesting that people

north, to the north of L & M, not to the north, of Backus, rather, you know, within that 30-minute radius of Backus, it would be approximately 50 minutes to get to Backus if they were at the outer perimeter of the radius from Backus, if you will.

MS. SCHAEFFER-HELMECKI: But if they were presenting at Backus and they had to be transferred to another facility, it would be less than 30 minutes to get to L & M?

DR. KIERNAN: Yes.

MS. SCHAEFFER-HELMECKI: Okay, thank you.

MS. VOLPE: That addressed our question, and that is specific to what the guideline states.

HEARING OFFICER HANSTED: Attorney Cohen?

MR. COHEN: No further questions for Dr. Kiernan. We're done with our Redirect.

HEARING OFFICER HANSTED: Okay. Let's take a 10-minute break at this point, and then we'll get to you.

MS. VOLPE: Thank you.

MR. COHEN: Just so that we're clear, Mr. Hansted, after the break, what will occur?

HEARING OFFICER HANSTED: Attorney Volpe will proceed with her Cross.

MS. VOLPE: No.

HEARING OFFICER HANSTED: I'm sorry.

MR. COHEN: No. She's done her Cross already.

MS. VOLPE: Attorney Cohen will have the ability to Cross-Examine the Intervenor.

MR. COHEN: Correct.

HEARING OFFICER HANSTED: Thank you for clarifying that. It's been a very confusing two months' worth of hearing, coupled with the microphone passing. That's what will happen, Attorney Cohen.

MR. COHEN: Thank you.

(Off the record)

HEARING OFFICER HANSTED: Okay. We are back on the record. Attorney Cohen, if you want to proceed?

MR. COHEN: Thank you. Dr. Cambi, can you tell me what is L & M's service area?

MS. VOLPE: L & M's service area? Sure. I'm sure we have that.

DR. CAMBI: Primary? Secondary?

MR. COHEN: However you want to define what's your service area.

MS. VOLPE: We can provide that, but I

don't know that I have it right now.

HEARING OFFICER HANSTED: Okay.

MS. VOLPE: It's on the website. OHCA has it. I mean you can ask a question.

DR. CAMBI: I don't know the names of all the towns off the top of my head.

HEARING OFFICER HANSTED: Okay, so, he doesn't know at this present time. Would you like him to file a late file?

MR. COHEN: No.

HEARING OFFICER HANSTED: Okay.

MR. COHEN: Dr. Cambi, do you -- does your service area include all of the individuals in the Backus angioplasty region?

DR. CAMBI: No.

MR. COHEN: What individuals does it include?

MS. VOLPE: What individual or town?

MR. COHEN: Towns, zip codes, individual people, if he knows any.

HEARING OFFICER HANSTED: Well that would be tough to answer.

MR. COHEN: Out of 230,000, it would be.

DR. CAMBI: I can answer it. Maybe this

is the best way I can answer it. My service area is any patient that presents to me at L & M Hospital or is referred to me in my outpatient practice by another colleague.

I have patients that come as far as New York, Massachusetts and Rhode Island, so I consider all of those areas my service area.

MR. COHEN: How many patients from the Backus angioplasty region, as defined in this application, have you provided PCI services to?

DR. CAMBI: I don't walk around with that number, but I'd be happy to put them together for you.

MR. COHEN: Is there anyone on your witness panel that knows the answer to that question?

DR. CAMBI: Are you talking about in all my years performing interventions?

MR. COHEN: Well we can start with 2015. How many patients? This is a critical question, because you're claiming that this is going to have a significant impact on your program. You must have calculated how many patients are --

HEARING OFFICER HANSTED: Doctor, he's not talking specifically to you. He's talking about L & M's program.

MS. VOLPE: Well we can address the financial impact. I think that's your question.

MR. COHEN: Well I did not ask a financial --

HEARING OFFICER HANSTED: No, that wasn't the question. (Multiple conversations) One at a time, please.

MS. VOLPE: The numbers of patients that we service, I mean you provided the number, and we responded to it, so it's in the application.

MR. COHEN: Again, I'm going to ask. Their testimony was that this program will have a significant detrimental impact on them, because we are going to take many of their patients.

I want to know how many patients. The answer could be I don't know, but I want them to answer the question, as to how many patients.

MS. VOLPE: We're ready to answer the question.

MR. COHEN: Thank you.

MS. PATEL: This is Shraddha Patel. According to the data that actually Backus put together, based on our information that we provided, will go on a quarterly basis. There were 32 cases in fiscal year '15

that emanated from the angioplasty region, and that's about -- and we have a total of about 200 cases, so that's a significant portion.

MR. COHEN: Two hundred and 16 cases, is that correct?

MS. PATEL: Correct.

MR. COHEN: Okay and, in 2014, how many cases originated from the Backus angioplasty region?

MS. VOLPE: So that number was --

MR. COHEN: I'm sorry. I would like the witness to --

MS. VOLPE: No.

HEARING OFFICER HANSTED: She's just clarifying the question.

MS. VOLPE: So the number we just gave you was 2015, which is more recent. You'd like us to give you 2014?

HEARING OFFICER HANSTED: That was the question, yes.

MS. VOLPE: Okay. Do we have that? I mean we're looking through the application, because it's in there, because the Applicant provided it, so, I mean, we're happy to find it.

I think, if he wants to ask his follow-up

question, but, I mean, we testified in 2015 it was 32 cases, which is, you know, in excess of 15 percent of our --

HEARING OFFICER HANSTED: Okay, one moment. Attorney Cohen, we're looking for that information, also. Do you know that you've already supplied that to save us some time, because I'm happy to come back for a third day of hearing.

MR. COHEN: Page 487.

HEARING OFFICER HANSTED: Thank you. All right, do you have another question, based upon that volume?

MR. COHEN: Can you tell me how many procedures were performed from the Backus angioplasty region at L & M in 2014?

HEARING OFFICER HANSTED: We're going around in circles. You just said you supplied that information.

MR. COHEN: I'm going to follow-up.

HEARING OFFICER HANSTED: Okay and what page is that on?

MR. COHEN: This is on 487.

HEARING OFFICER HANSTED: Page 487.

MS. VOLPE: Yup, we have it.

HEARING OFFICER HANSTED: Okay.

MS. VOLPE: What's your question?

HEARING OFFICER HANSTED: What was the volume for 2014 from the Backus region?

MS. PATEL: Twenty-two cases.

MR. COHEN: And how many of those were primary?

MS. VOLPE: I mean just in the interest of time, he's asking us to restate things that's in his application, so if we can get to the question, I think that would be important.

HEARING OFFICER HANSTED: And that was what I was hinting at before. I'm happy to have you lead the witness if you want.

MR. COHEN: Fine. I thought I'd face objections to that, but would you agree that there were two primary angioplasties performed at Backus, at L & M from the Backus angioplasty region in 2014?

MS. PATEL: I'm sorry. Can you say that question again, please?

MR. COHEN: This is like pulling teeth. Please turn to page 487.

MS. PATEL: I have it here.

MR. COHEN: On the upper left-hand corner,

do you see primary PCI?

MS. PATEL: Yes.

MR. COHEN: How many do you see in 2014?

MS. PATEL: Two.

MR. COHEN: And elective PCI inpatient, do you see that reference?

MS. PATEL: Yes, I do.

MR. COHEN: Those are the patients that Dr. Cambi testified to earlier, is that correct, patients that present at L & M Hospital that are inpatient and need a cath, is that correct?

MS. PATEL: Correct.

MR. COHEN: Okay, so, what's the total there for 2014?

MS. PATEL: Well 2014, it's seven. It's very different in '15, fiscal year '15, but, for fiscal year '14, it's seven.

MR. COHEN: Fiscal year '15 is the high watermark, isn't that right?

MS. PATEL: I don't understand what you're saying.

MR. COHEN: So do you know the numbers for 2016?

MS. PATEL: No.

MR. COHEN: You presented two years, two quarters of data to OHCA. Do you know those numbers?

MS. PATEL: I do not.

MR. COHEN: Would it surprise you if there were four primary PCIs and four elective caths from the Backus region that presented at L & M?

MS. PATEL: I know that PCI volumes are declining statewide and nationally, so it doesn't completely surprise me that volumes from any town would be lower this fiscal year --

MR. COHEN: So your testimony is that you would have less caths, you would have less PCIs this year than you would last year?

MS. PATEL: Again, this year is not complete yet, so I can't answer that question, but you're asking me if I would anticipate lower volumes. Potentially, just because of how things are tending statewide and nationally.

MR. COHEN: Sure. So would it surprise you that, in 2015, the first two quarters, you had 70 PCIs done at L & M, I'm sorry, 2015, you had 70, and, in 2016, your data reflects that you had 85? That's a significant, approximately 20 percent, increase in PCIs, so do you want to restate your answer to the question?

DR. CAMBI: Those last numbers, just clarify for me, if you wouldn't mind. Are those primary PCIs or?

MR. COHEN: Total.

DR. CAMBI: Total. That wouldn't surprise me. As you know, we were granted elective PCI in 2013. As you begin a novel program, it's important to do the lowest risk patients first, and then, as the program matures and develops and word of mouth spreads, it's natural that volumes increase as time goes on.

MR. COHEN: So --

DR. CAMBI: Let me just finish, if you don't mind. So that doesn't surprise me, that volume has increased by that amount over those two time periods.

MR. COHEN: Okay, but that increase is all from other than the Backus angioplasty region. As I indicated to you a few moments ago, there's eight of 85 procedures in 2016 that you guys have reported.

That's OHCA data, so it shows that, in fact, there's an increase in PCIs being done at L & M Hospital.

DR. CAMBI: The only thing that registered to me was that, in the most recent complete fiscal year's worth of data you reported -- how many patients from

their angioplasty region?

MS. VOLPE: Thirty-two.

DR. CAMBI: Thirty-two, which is the highest number reported so far, in terms of fiscal year data that's complete, which makes sense to me, because volumes increasing.

If we were to lose that number, our volume would be substantially reduced, and, as you probably know, the metric for quality programs that combine elective and emergency PCI is 200.

MR. COHEN: We'll ask about that in a minute. So, Dr. Cambi --

DR. CAMBI: Mr. Hansted, can I finish my comment?

HEARING OFFICER HANSTED: No, no. You know what? Here's how we're going to proceed from now on. There's going to be a very direct question from Attorney Cohen. There's going to be a very direct answer from this side of the room, okay? Otherwise, we will go into a third day of hearing, all right? Thank you.

MR. COHEN: Thank you. Dr. Cambi, you did not know what L & M's service area is for angioplasty services, other than to say that you serve whatever patients come to your door, correct?

DR. CAMBI: I don't remember my exact words, but that was the essence of it. My job is to perform angioplasty and stenting in heart attack victims, not know what my service area is.

MR. COHEN: Do you serve patients -- have you served patients in the last two fiscal years from Norwich? You testified in your pre-filed testimony and in your hearing testimony that the 230,000 patients in this angioplasty region are patients that you serve, so have you served patients in Norwich?

DR. CAMBI: In fiscal year '15, over 15 percent of the patients that I've performed an intervention on or that were performed by a Lawrence & Memorial program came from the angioplasty region, yes, sir.

MR. COHEN: So you serve patients in the Northeast corner of the state?

DR. CAMBI: I cannot say for sure what zip code each patient came from.

MR. COHEN: You heard earlier that the inpatient discharge data reflects that, in the angioplasty region, only three percent of the patients are L & M patients.

MS. VOLPE: What's the question? Where is

the question?

HEARING OFFICER HANSTED: Well he's leading the witness, which, at this point --

MS. VOLPE: Well just ask the direct question, like the Hearing Officer requested. What is your question?

HEARING OFFICER HANSTED: What is the question, Attorney?

MR. COHEN: The question is that we take a great exception to their unfounded statements -- (multiple conversations).

HEARING OFFICER HANSTED: Wait, wait, wait, wait. Stop. I asked you what your question was, not what your exception was, so just ask your question to the witness.

MR. COHEN: Yeah. I'm asking how they can sit here and tell us that this 230,000 patient region is within their service area when they do not serve these patients. Three percent of the inpatient discharge from the -- (multiple conversations).

HEARING OFFICER HANSTED: Attorney Volpe, he did not testify that he doesn't serve those patients. He testified that he does not know the exact originating town for each of his patients.

MR. COHEN: I understand that. In the prior hearing and in their pre-filed testimony, they said that this area with 230,000 patients is within their service area. I'm trying to discern how they make that decision.

MS. VOLPE: That's not what he said, so please ask your question. I think he answered it.

MR. COHEN: Are the 230,000 patients that are in the angioplasty service area, angioplasty region, within the L & M service area?

DR. CAMBI: Again, I don't know how one defines service area. All I can tell you is, based on the data you provided us, that, in fiscal year '15, 32 patients came from, the way you define things, the angioplasty region, and, if we lost that volume, we would fall below the threshold needed to continue to run a quality combined PCI program.

That's really what you're getting at, right, how much volume, if your program went live, would come out of L & M? There's your answer, and that's its effect.

MR. COHEN: Is there anyone on the panel that can answer that question?

MS. VOLPE: Well what is the question?

MR. COHEN: Whether the 230 patients in the angioplasty, the Backus angioplasty region are within L & M's service area.

HEARING OFFICER HANSTED: The 230 patients from --

MR. COHEN: -- 230,000 patients are within the L & M service area. Either their CMS service area, 75 percent, or their set primary service area, their secondary service area --

HEARING OFFICER HANSTED: So you want to know what the overlap is between the L & M service area and the Backus service area?

MS. VOLPE: No, because they define it as an angioplasty region, so it's not their Backus service area. I think the operative question is you're saying, of these 230,000 patients, which you're defining as a separate angioplasty region for purposes of this application, how many are coming to L & M? I mean that's the question.

MR. COHEN: The question, again --

MS. VOLPE: Whether it's our service area or not --

HEARING OFFICER HANSTED: Attorney Volpe --

MR. COHEN: I want to know -- we'll parse it down. If the answer is we don't know, we'll move on. Of the 230,000 patients in the angioplasty region, how many of them are within any defined L & M service area? CMS service area at 75 percent? Primary, 25 percent?

HEARING OFFICER HANSTED: Attorney Volpe, do you have anyone here that can answer that question?

MS. VOLPE: I would ask how many are in Backus' defined CMS service area.

HEARING OFFICER HANSTED: No. My question, Attorney Volpe --

MS. VOLPE: We have the ability -- you're defining service area arbitrarily. If we're trying to determine a population that's being treated now, are we treating some of that angioplasty region? I think we answered that question.

MR. COHEN: We didn't ask that question.

MS. VOLPE: If you want us to do --

HEARING OFFICER HANSTED: Attorney Volpe, my direct question is do you have anyone here present today that can answer that specific question?

MS. VOLPE: The question being how many in their made up angioplasty region of towns are in our primary or secondary service area? Is that the question?

HEARING OFFICER HANSTED: How many of the 230,000 people?

MS. VOLPE: But the 230,000 come from a region, right?

HEARING OFFICER HANSTED: I understand that. I just want to know, yes or no, do you have someone here that can answer that question, however that question --

MS. VOLPE: That is not a question that --

HEARING OFFICER HANSTED: Well that's his question. My question is do you have someone that can answer that specific question?

MS. VOLPE: So, just to clarify the question from Attorney Cohen, his question is, of the 230,000 patients --

HEARING OFFICER HANSTED: No, people.

MS. VOLPE: Of the 230,000 people --

MR. COHEN: In the angioplasty region defined by Backus in its application, how many of those people are in any L & M-defined service area?

MS. VOLPE: We don't know the answer to that question.

MR. COHEN: Okay. They testified that there was in that area, yes. Next question. Dr. Cambi,

you testified at the last hearing that it is critical to restore normal blood flow to compromised heart muscle for patients who are suffering from a heart attack. Do you remember that testimony?

DR. CAMBI: Yes.

MR. COHEN: Do you agree that PCI is the preferred therapy to treat STEMIs?

DR. CAMBI: With the caveat that it needs to be delivered in a timely fashion, yes, sir.

MR. COHEN: Okay. Are you familiar with guidelines requiring that a patient is more than 30 minutes from the PCI-capable facility that that patient needs to be routed to the nearest hospital?

DR. CAMBI: Which guideline statement are you referring to?

MR. COHEN: I'm asking if you're familiar with any guidelines requiring a patient that's more than 30 minutes from a PCI-capable facility have to be routed to the nearest hospital or emergency department.

DR. CAMBI: I am not familiar with any national guideline that mandates --

MR. COHEN: I didn't say national guideline. I said any guideline.

HEARING OFFICER HANSTED: Attorney Cohen,

do you have a guideline in front of you that references the 30 minutes?

MR. COHEN: There is a Department of Public Health OEM guideline that's interpreted by the folks in the eastern region that require that if a patient is more than 30 minutes from a PCI-capable facility, they'd be routed to the nearest ED.

HEARING OFFICER HANSTED: What's the date of that document?

DR. CAMBI: 2012.

HEARING OFFICER HANSTED: So you're familiar with that document, Doctor?

DR. CAMBI: If it's the one I think it is, it's the 2012 state document.

HEARING OFFICER HANSTED: Attorney Cohen, is it dated 2012?

MR. COHEN: Yes, it is.

HEARING OFFICER HANSTED: Doctor, are you familiar with that document?

DR. CAMBI: I am.

HEARING OFFICER HANSTED: Okay. Next question.

MR. COHEN: Doctor, under that guideline to transfer a patient to a -- routed to the nearest

hospital if there's no PCI facility within 30 minutes, what happens in that situation if the patient is 50 minutes from a PCI-capable facility and 25 minutes from another ED, a hospital, or a standalone ED?

DR. CAMBI: Okay. You're creating a hypothetical patient, right?

MR. COHEN: Yes. There are real-life patients that fall into that category.

DR. CAMBI: Well we can't talk about them. It's a HIPAA violation, but there's a hypothetical patient, right, who is how many minutes from a hospital?

He's picked up by EMS. I just want to understand the nature of your question.

MR. COHEN: The patient is more than 30 minutes from a PCI-capable facility.

DR. CAMBI: Is he more than 30 minutes from any hospital?

MR. COHEN: No.

DR. CAMBI: Okay, so, he's picked up by an ambulance? EMS? He's driving? What's happening?

MR. COHEN: Either way, ambulance or EMS.

DR. CAMBI: So he calls 9-1-1, EMS gets there, he's having crushing chest pain, the guidelines state that that patient should be brought to the nearest

hospital, unless there is a PCI-capable hospital within 30 minutes. In that case, the patient should be brought directly there.

MR. COHEN: Thank you. So you agree that if the patient in the angioplasty region is more than 30 minutes from L & M and that patient is suffering chest pains or some other incident like that, that that patient should be brought to the nearest ED, is that correct?

DR. CAMBI: If the patient is more than 30 minutes from L & M and they're having chest pain and we don't have a STEMI identified, correct, they're just having chest pain, and you're worried about an MI, they get brought to the nearest treating emergency room.

MR. COHEN: Thank you.

DR. CAMBI: Do you want me to tell you what happens next?

MR. COHEN: I didn't ask that question.

DR. CAMBI: Okay.

MR. COHEN: Now I'd like to look at page six of your pre-filed testimony, which is page 0019 of your filing. There's a chart of travel time by town to the closest PCI provider.

MS. VOLPE: So is this Dr. Cambi's testimony?

MR. COHEN: No. It's your testimony.

HEARING OFFICER HANSTED: Your, being who?

MR. COHEN: The Intervenors.

MS. VOLPE: It looks like Mr. Rissi's. Dr. Rissi. So bates stamp 0?

MR. COHEN: 00019. It's in Dr. Cambi's pre-filed testimony.

MS. VOLPE: 19?

MR. COHEN: 19.

HEARING OFFICER HANSTED: Dr. Cambi's pre-filed testimony?

MR. COHEN: Yes.

MS. VOLPE: Okay.

MR. COHEN: Do you have that in front of you?

MS. VOLPE: We're getting that.

MR. COHEN: Okay. Let me know when you're ready to go. Specifically, on page 19, I'm looking at the chart. Travel times by town to the closest PCI provider.

MS. VOLPE: Okay. Ask your question.

MR. COHEN: Now this is directed to Dr. Cambi. Looking at the chart, Dr. Cambi, would you agree that there are 15 towns that have a drive time greater

than 30 minutes to the closest PCI provider? Is that yes?

DR. CAMBI: Yes.

MR. COHEN: Okay, thank you. Part of the DPH OEMS guidelines that we just discussed, wouldn't residents of those towns be routed directly to the closest ED and not to L & M?

DR. CAMBI: Well it depends on who is their medical oversight according to the specifics and the dated guideline from 2012, if I'm reading it correctly. Decision regarding appropriate destination hospital should be made in conjunction with indirect and/or direct medical oversight if transport time is greater than 30 minutes.

MR. COHEN: So if a person in Canterbury is having a heart attack or crushing chest pains and they're 21 minutes from Backus according to your chart and 38 minutes to L & M, they'd have to stop at Backus first, isn't that correct?

MS. VOLPE: No, it's not correct.

MR. COHEN: I'm sorry. I'd like the witness to respond.

MS. VOLPE: I'm giving him the guideline.

DR. CAMBI: That's not exactly what it

says here, no, sir.

MR. COHEN: Are you saying that's the way in the field that it's practiced, how you've just indicated, or is it practice that, if it's over 30 minutes to a PCI-capable facility, that's transferred to the nearest ED?

DR. CAMBI: I'm sorry. Could you just repeat your question again?

MR. COHEN: So in the field, as it's practiced today, if someone is more than 30 minutes from a PCI facility, where do they go? Do they go to the PCI facility, or do they go to the nearest ED?

DR. CAMBI: I can't tell you where all those patients go. I'm not privy to that information. I can tell you that the guidelines suggest they talk to someone with medical oversight to help guide them.

MR. COHEN: Do you agree that PCI is the preferred treatment for heart attack over thrombolytics, as you testified earlier, if performed within 120 minutes of onset?

DR. CAMBI: Yes.

MR. COHEN: And how about if it's performed within 90 minutes of onset?

DR. CAMBI: If primary PCI is performed

within 90 minutes, it is a better treatment than thrombolytics. That's your question?

MR. COHEN: Yes, thank you.

DR. CAMBI: I agree with that, yes.

MR. COHEN: Would you agree with the statement that the goal with regard to PCI patients is to clear the vessel as soon as possible?

DR. CAMBI: Well the primary goal is to save their life. The secondary goal is to minimize the amount of permanent heart damage.

MR. COHEN: And -- go ahead. Sorry.

DR. CAMBI: The best way to do that, if you can deliver a reperfusion strategy with a balloon, is to do so less than 90 ideally, less than 120 minutes if you transfer. If you can't do that, Attorney, and it takes you longer than 120 minutes, then the best treatment to reduce mortality and permanent heart damage is, indeed, thrombolytics.

MR. COHEN: So would it be better to open that vessel in 30 minutes rather than 120 minutes?

MS. VOLPE: We established this already. I'm going to object.

MR. COHEN: No, no, no.

MS. VOLPE: We've established this over

and over.

HEARING OFFICER HANSTED: He can answer the question.

DR. CAMBI: Yeah, I agree with my colleague, who mentioned it earlier. The sooner you can open the vessel, Attorney, data clearly shows the better off you are. The difficulty is you can't have a PCI program in every town.

MR. COHEN: I don't think anyone is suggesting that. So you would agree that time correlates to heart muscle as a general statement?

DR. CAMBI: Time to reperfusion correlates to extend of heart muscle damage and mortality. I would agree with that.

MR. COHEN: Thank you. So if a patient had access to PCI at Backus rather than having to be routed to Backus and then transferred to L & M or another facility, as a doctor, you'd agree that it would be better for the patient to be treated at Backus, correct?

DR. CAMBI: No.

MR. COHEN: Why not?

DR. CAMBI: Because -- this is going to be a long-winded answer. I'm sorry. First of all, you imply that Backus already has a well-established, high-

quality program, which they do not.

Secondly, in the application, you discussed that it takes 50 minutes to get the cath lab ready, and, so, that time, that small time savings by arriving at Backus sooner than L & M is completely lost when you consider how long it takes the cath lab to get ready.

Now I agree with Dr. Kiernan that that's not the case all the time, certainly, but approximately 25 percent in our experience, maybe 30 percent, are field activations. There are lots of patients, who drive themselves directly to the emergency room or who are transported with other ways, by other means, rather.

MR. COHEN: Okay, so, you remarked in the hearing that having PCI available within a 30-minute drive is impractical, and that, quote, and this is page 52 from the transcript, "You could go down to Stop & Shop and get your angioplasty for a heart attack."

You go on to say that the 2014 SCAI ACC/AHA guideline supports your conclusion. Are you aware that the conclusion of that document has the following qualifier that you neglected to mention, which is, quote, "New programs offering a PCI without on-site surgery are inappropriate, unless they can clearly serve

geographically-isolated populations?"

MS. VOLPE: Again, what's the question?

HEARING OFFICER HANSTED: No, he did.

MR. COHEN: I asked a question.

DR. CAMBI: The difficulty is that there is no geographic isolation in our state, based on its definition in the document you just referred to, because there is a PCI-capable hospital within 30 minutes, a non-PCI-capable hospital, such as your program, to remind you 17 miles, 21-minute drive time, therefore, the definition, the way it's described in this guideline, does not apply to your facility.

MR. COHEN: We'll address that, I guess, when OHCA has some additional questions for our witnesses. I think our witnesses disagree with those conclusions.

Dr. Cambi, at the last hearing, you stated that the Applicants do not sufficiently set out their staffing requirements and that they'd be creating an environment of inexperienced supporting providers that may lead to unnecessary complications. Do you recall that statement?

DR. CAMBI: In general, yes, sir.

MR. COHEN: So page 57 of the transcript.

How do you define experience in that context?

DR. CAMBI: I would say, having done a requisite number of procedures that involve balloon angioplasty, stenting in a cohort of patients, who are suffering from an ST elevation MI.

MR. COHEN: And what's that requisite number of patients?

DR. CAMBI: I don't have a hard data point or a guideline statement, but if you're asking me my opinion, I would say, for staff to be competent, on the order of 50-plus. We're talking about ancillary staff, or we're talking about interventional operators?

MR. COHEN: Interventional operators and ancillary staff, nurses and techs, so you can answer each individually, if you'd like.

DR. CAMBI: Yeah, sure. So the interventional operators there is some concrete guideline recommendation to maintain competency. You can correct me if something new has come out. Don't hold me to these exact numbers, but, in essence, you should do 70-plus interventions a year, roughly 11 of which should be ST elevation MI, and they usually give a grace period and let that ride over a two-year period, so on average.

In other words, some year you might have

less. Some year, you get more.

MR. COHEN: And how about for staff?

DR. CAMBI: That, I honestly I don't know what the minimum competency is for a cardiac cath lab nurse or a radiologic technologist, in terms of how many PCIs they need to be a part of to be considered competent, but I can tell you the more you have under your belt the higher the quality, the lower the complication rate. That's fact.

MR. COHEN: When did L & M's primary PCI program start? Do you recall?

DR. CAMBI: In 2006 was the first iteration. 2008, May.

MR. COHEN: I asked about primary.

DR. CAMBI: 2008.

MS. VOLPE: Is that in our pre-filed testimony? I mean is that a question that we presented in our pre-filed testimony?

MR. COHEN: It's related to these issues. I can go directly to the question.

HEARING OFFICER HANSTED: Is that in the pre-filed testimony?

MR. COHEN: I do not recall. Yes, it is in the pre-filed testimony. They talked about when their

program started and then when they got PCI.

HEARING OFFICER HANSTED: Okay, so, he answered it. 2008.

MR. COHEN: 2008. And when were you hired into that program?

DR. CAMBI: I was hired into this program -- we started in 2008, so I was already on the staff at Yale. I just sort of transferred over.

MR. COHEN: And when were you Board Certified?

DR. CAMBI: In interventional cardiology, 2007.

MR. COHEN: Okay, so, at the time that you -- did you practice by yourself at L & M as an interventionalist, or were you under the tutoring or mentoring of another physician?

DR. CAMBI: In the beginning, it was myself and Dr. Joe Brennan, who were running the program.

MR. COHEN: Was he an experienced physician?

DR. CAMBI: Yes.

MR. COHEN: Interventionalist?

DR. CAMBI: Yes.

MR. COHEN: Did he mentor you?

MS. VOLPE: Again, none of this is in our pre-file, so --

MR. COHEN: It's all directly related to it.

HEARING OFFICER HANSTED: Can I ask you what you're leading up to?

MR. COHEN: Well he's been testifying that our program is going to be with inexperienced practitioners and inexperienced staff. Our staff, as we've testified, is going to be trained at Hartford Hospital, and that they're not going to be inexperienced interventionalists, and I want to find out from him what is his position on what's experienced and inexperience.

And, in fact, our program will show greater experience in our staff and physicians than what he had when he was.

HEARING OFFICER HANSTED: Okay, so, why don't you just ask him what you think is qualified or inexperience versus experience?

MR. COHEN: I did. I did.

HEARING OFFICER HANSTED: Okay, so, let's move on from that, because you're asking his specific qualifications, and I believe he's already been qualified as a witness.

MR. COHEN: Okay, so, were you inexperienced at the time that you became the Medical Director of the PCI lab at L & M in 2008?

DR. CAMBI: No.

MR. COHEN: And why do you say that?

DR. CAMBI: Because I had been out of fellowship and already had the requisite numbers for angioplasty, in terms of the 70 and 11, because I was on staff at Yale-New Haven Hospital, an assistant professor there, and took routine call.

MR. COHEN: And how long were you on staff at Yale doing PCIs?

DR. CAMBI: I'm sorry. I missed that.

MR. COHEN: How long were you on staff at Yale doing PCIs?

DR. CAMBI: From --

MS. VOLPE: Why is this relevant?

HEARING OFFICER HANSTED: Let him answer the question.

DR. CAMBI: When I finished my fellowship until May of '08. I'm still on staff at Yale. I mean I've never left being on staff at Yale.

MR. COHEN: You said before you became the Medical Director of the PCI lab at L & M, that you were

on staff at Yale.

DR. CAMBI: Right. As the Medical Director of L & M, I remained on staff at Yale.

MR. COHEN: Thank you. That wasn't my question. How long before you were Medical Director at L & M were you on staff at Yale? You indicated that you were on staff. How long were you on staff at Yale?

DR. CAMBI: Approximately, 10 months.

MR. COHEN: Thank you. In your opinion --

MS. VOLPE: I have Redirect specific to that, if we can.

HEARING OFFICER HANSTED: Well why don't you let him finish his questions? I'll allow you Redirect once he's complete.

MS. VOLPE: Okay.

MR. COHEN: In your opinion, Dr. Cambi, what percentage of the PCIs that come into L & M cannot be done at a community hospital without on-site backup?

DR. CAMBI: So one percent of the PCIs. So we're eliminating now STEMIs, right?

MR. COHEN: Correct. It's only elective.

DR. CAMBI: Only electives. Of the elective cases that come into L & M, what percent do I think should be appropriately done at a tertiary center,

because they're too complex, right?

MR. COHEN: What percentage that come into a hospital like L & M, a community hospital, without on-site backup, need to be done at a tertiary center, correct. Elective patients.

DR. CAMBI: Okay. I think I'm going to answer this right. Twenty-four percent. Twenty-six percent.

MR. COHEN: So that means that approximately 26 percent of the patients that come in to L & M should be transferred to Yale or another facility for PCI services?

DR. CAMBI: No. I would object to the word transfer. They're not transferred directly.

MR. COHEN: Okay.

DR. CAMBI: It's elective, right, so there's no urgency.

MR. COHEN: Sure.

DR. CAMBI: But they should be, in my opinion, have their complex angioplasty procedure either because the blockage is complex or because the patient is complex at a tertiary facility, like Yale or Hartford, correct.

MR. COHEN: Okay, so, you heard Dr.

Kiernan's testimony this morning that approximately 30 percent of the patients or so, 30 or 40 percent of the patients wouldn't be treated at Backus. You heard that?

DR. CAMBI: I did.

MR. COHEN: Okay, thank you. Do you know what percentage of the patients in the L & M catchment area or their CMS area that present with PCIs, elective PCIs, are done at Yale?

DR. CAMBI: You're asking for the total volume of patients in the L & M catchment area? What percentage of those PCIs are done at Yale?

MR. COHEN: Yes.

DR. CAMBI: No.

MR. COHEN: Would you venture a guess?

DR. CAMBI: I would not.

MR. COHEN: Would you be surprised that 51 percent of the patients --

MS. VOLPE: What's the question?

MR. COHEN: -- in the L & M service area have their caths done at Yale?

DR. CAMBI: Would I be surprised?

MR. COHEN: Yes.

DR. CAMBI: Nothing surprises me.

MR. COHEN: But that number is larger than

the 24, 26 percent you said earlier, correct?

DR. CAMBI: Fifty-one is larger than 26, yes.

MR. COHEN: And why is that? Why do these patients go to Yale instead of L & M?

DR. CAMBI: You'd have to ask them.

MR. COHEN: How often do you practice at Yale?

DR. CAMBI: You mean on main campus?

MR. COHEN: In your pre-filed testimony, you indicated that you practiced at Yale. How often are you at Yale? I don't believe you specified main campus.

DR. CAMBI: Sure. I perform procedures at Yale-New Haven Hospital on average one day per week.

MR. COHEN: One day?

DR. CAMBI: Correct.

MR. COHEN: So that's about 20 percent of your time?

DR. CAMBI: Correct.

MR. COHEN: Are those on L & M patients primarily, patients from the L & M area?

DR. CAMBI: Mixed. Some are patients, whose procedures that we deem too complex to be done at L & M. Because I live on site and the Medical Director at

L & M, we've established a rapport, so we schedule that patient electively to be done down at Yale-New Haven Hospital, and then I see them back at L & M for follow-up, however, because I'm on staff at Yale-New Haven, I act like any other University interventionalist and do other patients that come in from New Haven, or from MidState, or from Backus, etcetera.

MR. COHEN: So if L & M increased its share of patients from the 51 or 49 percent that are at L & M service, from the L & M service area, to the 76 percent -- let me rephrase that.

If L & M increased its share of patients that go to Yale today, wouldn't that solve all of your concerns regarding volume and quality?

DR. CAMBI: Completely speculative.

MR. COHEN: Wouldn't it solve your concerns if you increased your share of patients that from your catchment area, from your primary service area that go to Yale?

DR. CAMBI: With all due respect, I can't comment on that without knowing things about those patients. I don't know anything about them.

MR. COHEN: So do you think all 51 percent of them presented you with indications that would require

that they go to Yale, as opposed to L & M?

DR. CAMBI: Maybe.

MR. COHEN: You earlier testified that it was I believe 24 percent.

DR. CAMBI: No. So you're mixing up patient populations.

MR. COHEN: Okay.

DR. CAMBI: Of the patients, who present to L & M, we do about 600 diagnostic cases a year. Of those patients requiring an elective procedure, correct, approximately 74 percent are safely done, in my opinion, at L & M. Twenty-six percent go to Yale. I agree with that. I can't comment on a cohort of patients that I know no specifics about.

MR. COHEN: Thank you.

DR. CAMBI: You're welcome.

MR. COHEN: We have no further questions for Dr. Cambi at this time.

HEARING OFFICER HANSTED: Okay, thank you, counsel. I think this would be a good time to break for lunch. It's now 12:30, so we'll report back here at 1:30, and, during the lunch break, I'd like counsel to get together and, when we come back, have three alternative dates for a third hearing date, in case we

need them, so discuss that while you have your people here.

(Off the record)

HEARING OFFICER HANSTED: Welcome back, everyone. We are back on the record, and Attorney Cohen has informed me that the parties have agreed that they don't have any further questions, so we are going to go directly to OHCA's questions.

MS. SCHAEFFER-HELMECKI: Good afternoon. I'm Jessica Schaeffer-Helmecki for the record, and, firstly, I'm not really sure who to direct this question to, so I will just pose it, and we'll bring up whoever the most appropriate person is.

Why has Backus chosen to apply for both elective and primary programs, as opposed to just the primary program?

MS. EDWARDS: Backus chose to apply for primary and elective, because we do see a need for both in our region, so the 30-minute drive time helped us to define our angioplasty region, and, through that analysis, we found that 160,000 people were beyond that 30-minute drive time to access a primary or an elective PCI provider.

When we looked through the demographic

information of our region, we see that folks in our angioplasty region have a lower socioeconomic status, have a higher degree of cardiovascular disease burden in the co-morbid conditions that cause NSTEMI or other conditions, which could necessitate an elective PCI, and, ultimately, we want to improve the care coordination for patients of this region, so elective PCI patients can be unstable.

Although time is a little bit more of a luxury, my understanding in an elective case should happen between 24 and 48 hours from the time it's determined an elective PCI has to happen.

I'm not a physician, but that's my understanding of the typical time frame to have an elective PCI, and, at this point, we don't believe that it's optimal care to have patients travel to urban centers, like New Haven, or Hartford, or Worcester, where they're going today to receive that care, when we could provide it as part of a comprehensive program at Backus Hospital.

MS. SCHAEFFER-HELMECKI: Actually, I'd like to revisit that 24 to 48-hour period estimate for the elective.

MS. EDWARDS: Sure.

MS. SCHAEFFER-HELMECKI: Where did that number come from? You referenced, I believe, for the first time on 1507, and we're just a little bit curious, as to the origins of that and, you know, whether L & M would agree with that 24 to 48-hour period.

MS. EDWARDS: So that was information that I have obtained from my clinical team, so I'd like to turn it over I believe to Dr. Kiernan to answer that question, if that's all right.

DR. KIERNAN: Francis Kiernan. As I think Dr. Cambi alluded to earlier, coronary artery disease really spans an entire spectrum of patients.

The patients that need the most urgent care are the ones with STEMI. Those are the ones that we need to treat as soon as possible to help improve survival.

Sort of the next run of patients are the patients, who are having what's called non-STEMI. That is that they're on the verge of having a STEMI, but it's not quite happened. Those patients generally we treat pretty urgently, within one to two days.

Now if a patient like that presents to a non-PCI hospital, they're usually transferred for care, rather than discharge.

There's another group of patients that are really quite elective. That is they may have symptoms, such as angina. They may have a stress test in their physician's office, etcetera, that shows they need an angiogram. An angiogram can be performed, and if the disease seems to be stable, that can be scheduled electively in the future, perhaps even several days down the road, so there's really a spectrum of disease that we're talking about.

MS. SCHAEFFER-HELMECKI: Okay, so, the 48 hours is not necessarily a hard and fast?

DR. KIERNAN: No, certainly not after a, quote, "elective angiogram." The time really is critical in the STEMI. It's somewhat critical in non-STEMI, but not quite as urgent.

MS. SCHAEFFER-HELMECKI: Okay, thank you. So would Backus be open to just a primary program and not an elective program?

MR. FOREMAN: It's interesting. When we looked at the treatment on a per capita basis within this region, the need for elective PCI was actually higher, so if you look at ChimeData and do it on a per-100,000 basis and compare that data for this region to the State of Connecticut and the U.S., actually elective PCIs are 19

percent lower than the state and 41 percent lower than the U.S., so just if you think about it in whether or not people are getting care, the need for elective is arguably higher than the need for primary, although primary is driven more by drive time, obviously.

MS. EDWARDS: And to answer your question regarding if Backus would be open to having only primary PCI, I think at this point we truly believe that providing care to all PCI patients closer to home is the better option, but we are happy to have a conversation with OHCA directly after the hearing, if you'd like, but I think that should take place in a different setting.

MS. SCHAEFFER-HELMECKI: Okay, thank you. And this goes back to elective and primary issue, but being that elective angioplasties are scheduled and treatment is not limited, in terms of time or distance, why is there a clear public need for such a program at Backus, particularly in light of the fact that there are five other hospitals currently performing angioplasties that could be reached within the ideal plus or minus 48-hour window?

MS. EDWARDS: So, again, I'd like to turn this over to one of my clinical partners, however, I think Dr. Foley actually, as a cardiologist practicing in

the east region, might be better suited to answer this question, but, again, I think we would be asking residents of the east region to leave their home communities to travel to unknown care teams to receive that procedure.

We're asking them to do that today. They're leaving their home community. They're traveling to a physician that they don't know, a program that they are not familiar with. It creates anxiety, undue stress on that patient, when we would be capable of providing that at Backus through the Hartford HealthCare Heart and Vascular Institute, but I'd like Dr. Foley to speak more about that.

DR. FOLEY: Thank you. John Foley. I think it's a great question, and I sort of divide the people, who are going to be getting electives, into two groups, so they are the people, who come into the hospital, whether with chest pain or something else, and they certainly need a catheterization, which leads to an elective procedure, and then there are those people we see in our office.

Certainly, the people, who start off in the hospital, would benefit from continuing their care in the hospital.

The other folks, however, have relationships with us in the outpatient setting. I would say that, just a few days ago, the three cardiologists in Putnam are now part of the Hartford Medical Group.

We're already beginning to see some of their volume coming down for visits both in our office and, also, at Backus. In Hartford, the cath lab is also seeing some of those patients, so some of the patients that we talked about that electively and not electively went to UMass are now coming really into the Hartford system, because the people, who drove the referrals to UMass, are now driving their referrals to within the system that they now function, which is Hartford HealthCare.

So I think we're going to start to see, again, referral patterns, which we talked about earlier, shoring up a bit, and having the volume in the east region at Backus Hospital will increase.

We know the patients. The patients want to stay at a hospital and the physicians that they know. They want me to do their procedure and help make decisions with respect to do they get a stent, do they a get bypass, do they medical therapy? Those are complex decisions that are made by people, who know them, and the

patients want those decisions made by those of us.

The other is the transportation. I had mentioned it seems like 100 years ago at our first hearing, and it's good that we'll probably only have two, but I made the comment that, you know, there were patients in tears in my office when I said that they had to go to Hartford Hospital, and I know that sounded very dramatic. We could say I'm very dramatic, but those are real cases.

For a patient to electively go to Hartford Hospital or to Yale to get caths is, for some of them, a deal breaker, so, you know, when we talk practical patient care, we see this playing out, so that's why I think the elective piece is really important.

The other is that, through Lawrence's program, they've shown that elective and emergent angioplasty done in the community hospitals can be done safely.

OHCA already has established that, and that's why I think, when you ask why are we going for both, it's because OHCA was at the forefront, like some other states in the country, allowing elective angioplasty and not just requiring just STEMI, and I think, if Connecticut is sort of a Petri dish, the

experiment has worked and worked safely. We're confident that our lab can continue that.

MS. SCHAEFFER-HELMECKI: Okay, thank you. And now I want to touch on the angioplasty region, as you've defined it, and, again, dealing with the elective versus primary issue, so your whole Backus angioplasty region is based primarily on drive time, correct, whereas the elective is not based on drive time, so how do you kind of describe your elective angioplasty region?

MS. EDWARDS: So I'd like Shane Foreman to answer this question.

MR. FOREMAN: Yeah, so, for purposes of the assessment, we thought it would be doubly confusing if we were trying to use two different service areas for primary versus elective, in particular, because, because those elective volumes are driven through physician referrals, it's kind of an open question, as to where that elective volume would go, because it is physician-driven.

MS. SCHAEFFER-HELMECKI: Okay.

DR. FOLEY: I would just add to that, when you look at the map and the geography of the angioplasty region, we have Day Kimball Hospital, which is the Putnam Group, which is now part of Hartford HealthCare. You

have Plainfield walk-in, which is a very busy urgent care center, where a lot of the patients with STEMIs start and certainly people of unstable angina.

The Plainville area in January will have cardiologists from our group practicing in that office. We have Norwich, and then we have Windham Hospital within our outpatient setting there, so the same geography that makeup the angioplasty region are served by outpatient offices, which provide care, so they kind of are one in the same.

MS. SCHAEFFER-HELMECKI: Okay.

MR. FOREMAN: Just a point of clarification. So we used the 30-minute drive time for both, which I think is what you --

MS. SCHAEFFER-HELMECKI: Yes.

MR. FOREMAN: Thank you.

MS. SCHAEFFER-HELMECKI: Okay, thank you. Now according to your application, Backus transferred to Hartford still routinely exceed the recommended 90 minutes. Firstly, why was that 90-minute standard used, rather than the 120 that we discussed earlier?

MS. EDWARDS: So we used the 90-minute standard, because that’s the standard that we believe we should be holding ourselves to, and that’s the standard

we would be needing if we had a PCI-capable program at Backus Hospital.

As we've discussed, minutes mean muscle, and, so, we are holding ourselves to that Gold standard of 90 minutes.

MS. SCHAEFFER-HELMECKI: So why --

MS. EDWARDS: I'm sorry. I think we have one more point.

MR. FOREMAN: I was just going to add to that. Our entire assessment, which, then, is baked into the application, we took the approach as if what would this look like if Backus had it, so, if you think about it, that's how we did the service area, based on drive time, based on if Backus had this program, and then, similarly, that's the reason we used the 90-minute, as well.

MS. SCHAEFFER-HELMECKI: Okay, so, why are you exceeding the door-to-balloon time for transfers?

MS. EDWARDS: Why are we exceeding our door-to-balloon time? Dr. McClaine, as an Emergency Department physician, would you mind answering this question?

DR. McCLAINE: Hi. Kyle McClaine. So what we had said earlier and I can clarify further was

that, currently, we do have all EMS providers take an identified ST elevation MI directly to a PCI-capable center if they're within 30 minutes, which is currently Lawrence & Memorial, and that subset of patients comes right off the top. Because most of the clear MI patients bypass Backus entirely now, especially from the EMS arena, the data subset for the patients that we had that were transferred out is a somewhat skewed population, and, as I was testifying before, that subset includes a lot of patients that come in with one thing and ended up having an MI identified later.

A lot of those patients were sick elderly patients from a nursing home, who had pneumonia, and then you do your routine EKG later, and there's an MI there, as well, because all the cards are falling as the patient is succumbing to an illness, or someone, who comes in with chest pain and were thinking about MI, were thinking about angina, and then subsequent EKGs performed over time demonstrate that the EKG changes, so there are some patients with delayed presentations, confounding variables, things like that, that are in that patient subset, and then there is the reality of patient referral patterns.

There is physician concern that are taking

care of patients. Patients are their primary focus, and they're worried about the possibility of needing to have a second transfer to a surgical backup center. They're already at the first hospital. Time has gone by, and, if they get transferred to another non-surgical backup, that there could be a potentially other transfer.

Then there's the belief that they are making the metric, and it's hard to know, when you have multiple different centers, where we send patients. There was Yale, there was St. Francis, there's Hartford, there are a few at L & M, that the feedback loop to the physicians probably should have been better over the years, and there are times that we did not know that we're not making 120, or I think our median was 134 on those patients.

So, first of all, I remember that the clearest MIs aren't even in that group. These are the ones that, for whatever reason, weren't as clear, most of them, but, even still, you know, once you do identify that you're not making 120, there were some things about, when you talk to a cath lab PCI provider, some of the physicians on the receiving end were also comfortable going beyond 120, because they believe PCI is better.

Even though, as we talk in this

application, the guidelines are the guidelines, real physician practice sometimes even favors going a little bit farther for the preferred therapy, so there's a lot of reasons.

There's physician referral patterns, as well, so there's a lot of things that go into that, but, overall, I think the biggest thing to say is that we're not trying to optimize a 120-minute system. We're not trying to make it 134, 120. If need be, we will continue to strive to do so, but what we're really trying to do is make this a 90-minute benchmark. We don't want 120 minutes.

MS. SCHAEFFER-HELMECKI: Okay, thank you. Now, also, referring to referral patterns, I don't know if you need to continue to speak to referral patterns, but Day Kimball's 2015 CHNA implementation plan indicated a working relationship with UMass Memorial to treat the STEMI transfers from Northeastern Connecticut. If Day Kimball does refer patients to UMass, will you still be able to meet your 200 procedures per year threshold?

MS. EDWARDS: So, yes, we believe that we will still be able to meet our 200 PCI threshold per year, and that's for a variety of reasons.

I think one is that the Day Kimball

community health needs assessment implementation strategy supports our application, that cardiovascular disease is one of the most pressing needs in our community. They list it as I think their first community health -- their community health need.

Additionally, they state that they are transferring patients via helicopter, I believe, to UMass, which is not ideal. That's not ideal for our health care system, as far as cost. It's also not ideal for our patients, but, ultimately, Bob Smanik, who is the President and CEO of Day Kimball Hospital, wrote a letter of support for our application, where he stated that Day Kimball looks increasingly more favorably towards Backus as a source for specialty care, and that he wholeheartedly sees a need for this procedure to be located at Backus Hospital to give his patients a Connecticut option, where, currently, they don't have a Connecticut option.

And then, finally, I think Dr. Foley has already mentioned that Dr. Bradbury and his two cardiologists on his team, who also wrote a letter of support in favor of our application, are now employed by Hartford HealthCare Medical Group, and, so, we believe that that physician referral relationship will result in

some patients coming to Backus for their care.

Dr. Foley, do you have something to add?

DR. FOLEY: Yeah. I think, just to amplify, and I know we're under time constraints, but the idea of referrals have come up, and referrals really are me to you, one provider to another provider. It's because we have a relationship. I know you. I know the quality of care you can do. We communicate.

I trained at UMass. Before that, I was a nurse at St. Vincent's. I lived in Worcester, so I'm familiar with the geography and with the players. Great hospital, but most, if not, all of the cardiologists that have ever worked at Day Kimball have come and trained at UMass.

I was a fellow, and I used to moonlight for their practice, so when you talk about how does a Day Kimball patient show up at UMass with chest pain and an MI, it's because cardiologists are seen in the emergency room and fielding the phone calls or consulting in the hospital, and they're referring to people, because they have a relationship, but those relations are now different, so hospitals can't guarantee anything.

Our hospital can't guarantee that every patient, who comes into our ER, is going to go to

Hartford Hospital. I make that decision, and it's an independent decision, and it's a complicated decision sometimes, but I think that that relationship, I just want to say, is predicated really more by the physicians and their practice patterns than Day Kimball Hospital and UMass as hospitalists.

MS. SCHAEFFER-HELMECKI: So what is the travel time distance between Day Kimball to UMass versus Day Kimball to Backus? And I know you provided that information. I apologize. I just can't remember it off the top of my head.

MS. EDWARDS: Sure. So, interestingly, and I don't have it from Day Kimball proper, I have it from Putnam, that's how we did it in our late file, St. Vincent Hospital is actually the closest PCI provider to Putnam, and, so, that drive time is 28 minutes versus it would be 33 minutes from Putnam to Backus Hospital while also, of course, providing patients a Connecticut option for their care, and that's assuming that those patients arrive at the Day Kimball Emergency Department and don't seek emergency treatment for their symptoms at our Plainfield Emergency Department.

MS. SCHAEFFER-HELMECKI: Okay and UMass was?

MS. EDWARDS: UMass I believe is a little bit further than St. Vincent's, probably I think maybe five more minutes past St. Vincent's.

MS. SCHAEFFER-HELMECKI: Okay.

MS. EDWARDS: Somebody is showing me that it's 34 minutes.

MS. SCHAEFFER-HELMECKI: Okay, thank you.

MS. EDWARDS: Thank you.

MS. SCHAEFFER-HELMECKI: Okay. I am all set. Thank you.

MS. OLGA ARMAH: Good afternoon. My name is Olga Armah. I don't know who is going to answer the questions, but whoever gets the question, they can answer.

Did the Applicants explore the possibility of improving emergency medical transportation systems to diagnose and to transfer STEMI patients, such as training for EMT or ECGs on more ambulances?

MS. EDWARDS: I think Dr. Kyle McClaine would be the best suited to answer this.

DR. McCLAINE: Forgive me. Kyle McClaine. Forgive me. Can you just restate? I got the gist of it. I think I have it properly, but I want to make sure that I do.

MS. ARMAH: I'm asking if you explored improving emergency medical transportation system.

DR. McCLAINE: So what I had testified to before was that all paramedics -- actually, this might be some clarification. All paramedics can perform EKGs. The problem is is where are your paramedics, and where is the density?

If you're in the Norwich area, if you're in the New London area, there's a paramedic every inch, and you're tripping on them. They're always going to get an EKG in a timely fashion, and they use that in the case of an identified ST elevation MI to direct their patient to the closest PCI center if it's within 30 minutes, so that's a system that has always existed.

The improvement thing was something I was actually part of, was that some places there's not enough paramedics, and there are two hospitals to choose from. You don't have a paramedic there to do an EKG, and your EMTs, your basic level EMTs are ready to go, your patient is in the ambulance, you're looking at two different hospitals, one has a PCI center and one does not, and you don't know where to go.

And a pilot program was done in the Western part of the state a couple of years ago, and I

was part of the body that evaluated that pilot, and that was to say they got a good point.

They can't get a paramedic there in a reasonable time, and their patient could have been at either hospital before a paramedic even gets there, so they trialed a program by which they attached a black box type device to the patient, and that was transmitted to one of the hospitals, the PCI center, who then interpreted the EKG that was done and told the EMS crew come to us. You have a STEMI, come to us. You don't have a STEMI, go to the other hospital, or the closest hospital, or whatever hospital you want to go to.

So when you have a choice in the matter, that is a great way to expand what EMS can bring to the table. If you're presently in all of the towns north of Norwich beyond a 30-minute drive time to L & M, if you get up to those towns, you don't have a choice where you're going, you know?

And, also, truthfully, for the lower part, the paramedic density is fine, but up around the Day Kimball area, the paramedic density is just like that other part of the state, in that there's not a lot of paramedics, but it's unlike that part of the state, in that there's not PCI centers versus non-PCI centers to

choose from, so the part of my testimony that I was trying to say was, when Backus has a PCI-capable center, now you have a choice.

Are you going to go to Day Kimball, or Backus Hospital, or the Plainfield freestanding emergency department, Windham Hospital, L & M Hospital? You're going to have choices now, you know, if you have that 30-minute drive time. Does that answer your question?

MS. ARMAH: Yes.

DR. McCLAINE: So expanding EMS capabilities, without a choice for them to do anything with the data, doesn't change the outcome for any patients presently.

MS. ARMAH: Okay. Thank you. Have you developed an agreement with ground or air ambulance service capable of advanced life support that guarantees a transfer vehicle will be on site to begin transportation to backup surgery within 30 minutes?

DR. McCLAINE: So you're speaking not about the primary phase, but if a PCI was performed at Backus Hospital and it was determined that you had then to take the patient to a tertiary care center?

MS. ARMAH: Yeah.

DR. McCLAINE: That would be my job to do.

It's a very easy job to do. It's very similar to the transport of other patients, and I'm the Medical Director over the ambulance service that currently takes all of L & M's patients to Yale when that happens, and they also have Life Star. We have a facility hanger, and one of the Life Star vehicles is at our hospital, so those two systems are in place already. They oversee the medical aspects and the design aspects of what happens, you know, for the paramedic training and the Life Star.

It's in place already. It's just a small change to redirecting it for Backus, so Hartford already has that in place with Life Star, and then the ground is me.

MS. ARMAH: So can we have a copy of that agreement? Can I have a copy of that agreement?

DR. McCLAINE: That Hartford Hospital has with Life Star?

MS. ARMAH: Yes.

DR. McCLAINE: Yes.

HEARING OFFICER HANSTED: That will be ordered as Late File No. 2, and how long do you need to get that to us?

MS. EDWARDS: Just to clarify, so I understand fully what the late file is, you're looking

for a copy of agreements between Life Star and Hartford Hospital? Just to clarify.

HEARING OFFICER HANSTED: Any agreement for transportation that would be used in the situation that was just described.

MS. EDWARDS: Okay. For ground or air?

HEARING OFFICER HANSTED: Ground or air.

MS. EDWARDS: Okay.

DR. McCLAINE: So, to clarify just a little bit further, as I said, right now, Backus doesn't have a PCI center, so there is no written agreement for something that doesn't currently exist.

What I was saying was that, basically, L & M has an agreement to get their patients off, and they use paramedics that I have medical control over, so the aspects of it that I oversee are, when you're transferring a patient, what equipment do you need, what level of provider do you have, and then the helicopter is a separate thing, but Backus does not have a PCI center, so there is no agreement.

I'm just saying that the technical nature of how that would be done would be under my direction from the ground and in correlation with Hartford Hospital's Life Star program from the air, and they

currently transfer patients from PCI centers, not just L & M, but all over the place.

This is their regular, every day business, so I don't know if there is a document that already exists that is what you're looking for. I think I was trying to describe the system, but, if I may redirect on that, I don't think that document does exist or that it would help you, but if your question was --

HEARING OFFICER HANSTED: No, I understand what you're saying, Doctor, so I will vacate that order for Late File No. 2.

MS. ARMAH: All right, thank you. So why has Backus chosen to concede patients from Ledyard and Montville to L & M?

MS. EDWARDS: So I'd like Shane Foreman to elaborate on this, however, our application and our analysis was based completely on drive time, and we used Maptitude software to determine drive time, and those two geographies were closer, when we look at primary PCIs, closer to transport to L & M, per our analysis.

I think Shane, though, has some additional statistics to share with you.

MR. FOREMAN: Yes, thank you. Janette is correct. So the reason that we left it out of the

angioplasty region for primary PCI is because those zip codes were actually closer to L & M than to Backus, but when we went and looked, Backus actually has relatively low market share within those zip codes, so when we look at the Oakdale zip code, Backus has a 39 percent inpatient market share, Ledyard was 20 percent, Uncasville was 48 percent, and Gales Ferry was 19 percent, but I think the more important point is those zip codes produce extremely low case volume, so when we looked at the actual number of cases that we're talking about, it's four, and that's elective, just to be clear, for elective cases.

MS. ARMAH: All right, thank you. Page 1510 of the application shows a proposed service area for approved L & M PCI service area. How does Backus propose to minimize a potential shift in elective PCI volume from L & M?

MR. FOREMAN: So, as I think we previously stated, we believe that elective is driven primarily from physician referral patterns, and we don't believe that anything we're proposing will interrupt any existing referral patterns between L & M Hospital and their physician base.

Then, also, again, we're talking about

extremely low volume, so when you look at the number of elective cases that L & M pulls out of this region, it's almost non-existent, so we don't believe that we're going to interrupt their referral patterns, but even if there was some interruption in referral patterns, we're really not talking about any cases anyway.

MS. ARMAH: Given with the addition of elective PCI, L & M is a low-volume provider. Your proposal predicts low volume for Backus, as well. What will be the viability of the two programs, that is Backus and L & M, and the financial impacts on the health care system of the region?

MS. EDWARDS: So we are proposing in our application to serve a very different market than L & M. As we've discussed earlier today, I believe L & M has treated four elective cases and four primary cases from the angioplasty region this fiscal year, the first two quarters for this fiscal year, so they're not serving the region that we're proposing to serve today.

Additionally, the providers, who are serving the angioplasty region, mainly Hartford hospital, Yale and UMass, they are high-volume providers, where we don't believe that the shift to Backus will cause any material disadvantage to those hospitals, and, clearly,

Hartford Hospital is a co-applicant with us on this application, and, so, they see the value in establishing this program at Backus Hospital.

So I think, although we were conservative in our estimations for volume at Backus at 216 cases in the first year, we do make that minimum 200 ACC/AHA SCAI guideline, and we do anticipate growing I believe to 222 cases in subsequent years at a minimum, so we don't believe that L & M is treating this region today, and those providers that are treating this region are high volume.

And then, finally, we do believe that there's unmet need in our service area, given, again, the high rates of STEMI and non-STEMI cases and then the low rate of intervention to treat those cases, so we also believe that there's unmet need today in the market.

MS. ARMAH: So if the Applicants will be operating at a loss for an extended period, will the program losses be passed on to the consumer? That's what we see from the financials.

MS. EDWARDS: So, no, the program loss won't be passed on to the consumer. I think Dan Lorer can speak to programs that -- the financial viability of the program if you have questions about that, however,

no, we consider this a community benefit to the angioplasty region, and it's within the mission of Hartford Hospital, Backus Hospital and Hartford HealthCare to provide such services.

I don't anticipate us passing this cost on to the consumer.

MS. ARMAH: So how will you cover the loss?

MS. EDWARDS: Through operations, through our operations. And, also, I should point out that the way we modeled the loss for the three years was we assumed that we had no uptick and any reimbursement from any of the payers associated with the cases, but that we did include inflation and increased cost to the hospital, which is why the loss actually worsens in years one, two and three. We were conservative in that regard, as well.

MS. ARMAH: You stated in the application that the incidence of myocardial infarctions in Northeast Connecticut have increased 13 percent above the state average.

Do you have reason to believe this is due to the lack of a PCI program and not a result of a need for earlier intervention, specialty intervention, or additional primary care providers in the area?

MS. EDWARDS: So I think that the, and I'll have Shane Foreman speak more to how, to the instance and how we calculated that, but I definitely think that you're asking two questions.

So one, that, absolutely, there is a need for additional primary care physicians in that region. In fact, 11 of our towns are listed as health professional shortage areas, and three of the towns in the angioplasty region are listed as medically underserved areas.

We articulated in our application that Backus is a great supporter and provider of multiple community benefit programs, including cholesterol screenings, blood pressure screenings, smoking cessation programs, weight loss programs.

We have a bariatric surgery program, so we're trying to put a solid foundation for preventive programs in place within this region.

We extend that all the way up into Plainfield and beyond as far as we can in partnership with Hartford HealthCare and Windham Hospital, as well, so really trying to take a comprehensive look at the preventive care that we provide to this community, however, those interventions and those programs take many

years to turn the tide of the health care, the health and disease burden or status of a community.

So, as you can see from the Robert Wood Johnson Foundation data that we shared over the course of the last several years, Windham and New London County have made very little stride in improving many of these metrics, and that's just because public health interventions take a really long time to take effect.

So although we're continuing to build our preventive care foundation, we believe that there is a need for a PCI program to treat patients, who are suffering from these conditions today.

So, Shane, do you want to talk about our incidence rates?

MR. FOREMAN: Sure. I think Janette is 100 percent right. I think the underlying demographics and health status of this community are probably driving most of that, and, for me, I've looked at literally thousands of markets across the country.

My best estimate of this is it's just an isolated geography with the lack of access, and, so, that's why you're seeing trend lines that are counter to what you're seeing across the rest of the state and what we're seeing across the country.

MS. ARMAH: Thank you. In the 2014 consensus document, the document recommends that the cath lab staff and interventionalists should arrive within 30 minutes of the STEMI activation call.

The same travel challenges identified for hospital patients presume to exist for the physicians. Do you have a plan to provide such coverage, 24-hour coverage?

MS. EDWARDS: Sure. I'd like Dr. Kiernan to speak to how it will approach call coverage at Backus Hospital.

DR. KIERNAN: Yes. Francis Kiernan. We would plan to have physicians stay in the area, for example, who are on call to be close to the center, and we would mandate that the nursing and technical staff be available within 30 minutes.

We have that same system at Hartford. In fact, some of our nurses and technologists, who live out of our 30-minute window, actually stay in the hospital during their call periods, so that would be something that would be enforced.

MS. ARMAH: Thank you.

MR. DAVID FERNANDES: Good afternoon. My name is David Fernandes, and my questions will pertain to

Lawrence & Memorial.

My first question is how will access be maintained for towns in the angioplasty region that are more than a 30-minute drive to the nearest PCI provider?

MS. VOLPE: How would we maintain servicing them?

MR. FERNANDES: Correct, because I believe, on page 19 of the pre-filed testimony, the chart had 58 percent of the towns outside of the 30-minute travel time, so how would you maintain access to those potential patients?

MS. VOLPE: Well I think I'll let Dr. Cambi answer that.

DR. CAMBI: So I just want to make sure I understand your question. You're supposing a Backus proposal doesn't exist?

MR. FERNANDES: Correct.

DR. CAMBI: How would we maintain the 30-minute drive time for those patients, who live beyond those regions?

MR. FERNANDES: Correct.

DR. CAMBI: Yeah, I'm glad you brought that up. It's my contention that, throughout this hearing, we've lost a bit of focus.

The 30-minute drive time isn't what's important here. It's opening the blood vessel within guideline-recommended times of 90 minutes that they present to your facility or 120 minutes with inter-facility transfer, and, so, what I propose is that, in those patients, who are a greater than 30-minute drive time from Lawrence and arrive at Backus with an ST elevation MI, that Backus transfers those folks to us, where we demonstrated that we're more than capable in opening that artery in less than 120 minutes, certainly, and, in most cases, less than 90 minutes.

When you consider that a hospital similar to Backus in the form of Westerly is farther away than Backus, currently transfers patients arriving at its facility to us, and we open the artery in a median door-to-balloon time of 89 minutes, well below the 134 that Backus is currently getting and well within guidelines for a program either receiving inter-facility transfers or as if those patients were presenting directly, and, so, my solution to the problem in maintaining access for the patients you describe is not to invest millions of dollars in a new PCI program, but to develop mandates, greater EMS education and greater technology, so that those patients could be more effectively triaged to

Lawrence & Memorial Hospital, or Hartford, or UMass, or other programs in Rhode Island.

So, in that way, that's how we maintain appropriate access and guideline-directed care to those patients you describe.

MR. FERNANDES: Thank you. What is the potential number of cases that would shift from L & M to Backus if a program is approved?

MS. PATEL: So this is Shraddha Patel. The data that Backus provided in their CON application, our patient origin data, when we looked at that very closely, they speak to fiscal '15 numbers, 32 cases came to L & M from their angioplasty region.

That's significant, given that we have 216 cases total. What Backus failed to acknowledge, and I believe OHCA kind of addressed this in the completeness questions, is what about the towns of Ledyard and Montville, which are in the OHCA-defined service area for Backus Hospital?

That's another 19 cases, so that's a total of about 51 cases that would be potentially removed from L & M's populous of caseload with a Backus program in place.

MR. FERNANDES: So 51 total?

MS. PATEL: For fiscal year ’15, I’m talking about that patient origin data, but we also feel it could potentially be more. You just never know. Again, we talked about referral patterns and where EMS takes folks, so 51 is a conservative number from our vantage point.

DR. CAMBI: And I would just dovetail on that. You know, Backus creates a picture, where patients with ST elevation MI, who are currently coming to L & M, that won’t be disrupted, but you have to remember that there’s going to be some borderline zones, where EMS is in between Backus and L & M, where, currently, they all come to L & M.

Those patients are also going to now be going to Backus Hospital. Patients with STEMIs also often have, as Dr. Kiernan can attest to, an underlying burden of coronary disease that may and often requires additional now elective interventions.

Those are additional case volume numbers that would be lost to Backus, so it’s difficult for this panel, but important for you to understand that there is significant volume loss that can sometimes be hidden in the way you sort of carve out the data and create regions and so forth.

I thought I made this point, but my colleagues are reminding me to make it again, that if Backus were to get a primary PCI program, because of some of the volume shift we discussed, it would be difficult for us to maintain our ongoing quality metrics, as our threshold would fall below that sort of magic 200 number that you here discussed about in a lot of the guidelines and literature, but I think I said that earlier.

HEARING OFFICER HANSTED: I just want to go off the record for one minute.

(Off the record)

HEARING OFFICER HANSTED: Okay, we're back on the record.

MR. FERNANDES: Okay. This is most likely going to be a late file, but I'll ask the question. What would the estimated revenue loss to the L & M program if the Backus program is approved?

MS. VOLPE: I think we can probably be responsive to that today. Can you repeat the question?

MR. FERNANDES: Sure. What would the estimated revenue loss to the L & M program if the Backus program is approved?

MR. VanESSENDFELT: My name is Seth VanEssendfelt. I'm the Chief Financial Officer. In my

testimony I had filed, the net financial implication is we expect somewhere around $1 million, round numbers, and, so, it's not just the revenue, as we've talked about and had these discussions, even as Dan testified about the program. There's a pretty significant amount of fixed cost that goes into maintaining the program, and, so, the revenue loss has a significant impact, because there's very limited impact to expenses, so the expense structure kind of stays in place, despite lower volume.

For example, the revenue offset is almost one-for-one with the financial loss, so the revenue might be a little higher than $1 million, but the net financial impact is probably around $1 million, and that's, again, based on the assumptions that Shraddha outlined, as far as what we see as potential volume loss, based on '15 numbers.

Obviously, it's hard to forecast future implications.

MR. FERNANDES: Thank you. And then one last question. Would you explain why Backus has predicted 80 percent retention rate on page nine of the pre-filed testimony is unreasonable?

MS. VOLPE: The retention from --

MR. FERNANDES: I believe that was the 80

percent that they had come up with, as far as market share. Let me just get you the specific page number.

MS. VOLPE: Thank you.

MR. FERNANDES: So it's Exhibit R. I'm sorry. Pre-filed testimony, page nine, question seven.

MS. VOLPE: Do you have the bates stamp?

MR. COHEN: 0009.

MR. FERNANDES: Yes.

MS. VOLPE: Of our pre-file?

MR. COHEN: Yes.

MS. VOLPE: Okay, thank you.

MS. PATEL: I'm going to try to answer this question. So why we feel the 80 percent is unreasonable is, when we looked at our own internal data, statistics that come out of Chime, we were actually only retaining 54 percent of the STEMI cases that emanated from our primary service area.

Patients don't necessarily have their heart attack at home. They're out and about elsewhere, so I think some of the patient origin data can be misleading at times, so we felt that the 80 percent was grossly overstated, just judging by our experience, having done this for six, seven years. It didn't seem feasible to achieve that sort of rate.

MS. EDWARDS: May I just add a point of clarification? Is that allowed in this? So the 80 percent, which we talk about on page 489 of the application, that is our actual emergency department market share from the towns within 30 minutes of a drive time from Backus Hospital, so we utilized 80 percent, which, again, is the actual Hartford HealthCare ED market share from this region, because we assume that these STEMI cases are emergent cases, and they would be seeking care at Backus via EMS or otherwise, just like any other case.

So we have an 80 percent east region ED market share within that angioplasty region, and that's where that number came from.

MS. PATEL: Can I add something? We, if we did our own PSA, Primary Service Area, analysis for ED, it would be similar, if not, higher, so I think 80 percent is what we attract for ED patients only, but we're talking about STEMI patients. It's a whole different type of population. Fifty-four percent is what we're seeing. The 80 percent is probably similar to what L & M would see if we actually ran that analysis.

MR. FOREMAN: And I just have one additional point. I think, if you looked at their PCI

market share and thought about it in conjunction with their partner, which all those cases are leaving their region, it would probably be higher than 80 percent, the partner being Yale.

So if you think about what between the two of them, if you're attempting to compare apples-to-apples, what we're talking about is a Hartford HealthCare East Region as a health system, and what they and their partner at Yale will get out of that market is probably 80 percent, if not, higher.

MR. FERNANDES: Thanks.

MS. PATEL: I just have a clarifying question for the Backus team, but I know I can't do that.

MR. FERNANDES: That pretty much concludes that questions I had.

MS. SCHAEFFER-HELMECKI: Just one last point. There were a few late files that we wanted to request.

Firstly, we want to see, on page 1516, we wanted to see the table on that page updated to include fiscal year 2015 data.

HEARING OFFICER HANSTED: Page 1516, and that will be Late File No. 2.

MS. SCHAEFFER-HELMECKI: Okay and then the

second item, we also wanted the school year 2015 data added for the table provided on page 62 of the initial application, please.

HEARING OFFICER HANSTED: That will be Late File No. 3. All right, that concludes OHCA's questions and the late files.

I understand counsel would like to give brief closing statements, so I'll allow that. Attorney Cohen?

MR. COHEN: Bimal Patel is going to make a short statement, and then I'll have a very short conclusion after that.

MR. PATEL: Hi. Good afternoon. My name is Bimal Patel. I'm the President of East Region Hartford HealthCare. It's two hospitals; Windham Hospital and Backus Hospital.

Hearing Officer Hansted and the rest of the team, thank you for your questioning and wonderful conversation about the details.

I make rounds with communities, and about over the last six months, probably got 15 different communities that serve or that lives in the East Region.

Basic premise of that population is about access and the travel; access by site, location,

difficulties in travel. I'll give you a quick example. In Baltic and Sprague are the two, who are the most in-need towns among all 15 that I met so far.

Patients line up or the people line up for a food program three hours before the door opens at Sprague Community Center. Eighty percent of those people line up every other week for the food share. They come by walking to the area. The town population is 1,500 people.

The combined population of Sprague and Baltic is really less than 5,000. That tells you the health disparities what we are serving.

So with that note, let me tell you the testimony that we have put in front of you and they asked that we put in front of you is real, that there's a clear need for Backus to establish primary and elective PCI program to provide the much-needed cardiovascular health.

We do everything in prevention. Our Nurse Practitioner, Alice Fasanti(phonetic), goes over there and serves them to improve health conditions. I haven't seen anybody else do that work in the East Region. My team does that work, up and down in more than a 1,000-square-mile radius of the East Region.

We have 160,000 people, about 69 percent

of the population at least, do not have a 30-minute guideline. We heard about that today enough. We have 231 people, or thousand, rather, live in our Backus angioplasty region, who could afford and deserve a better access than what they have today.

We have heard from ourself, Backus Hospital, Hartford HealthCare. We have heard from a Town elected official on both days of hearing. You heard from me. You heard from Day Kimball. You heard from our EMS leader, who provides service in the East Region. You heard from the physicians, and you heard from patients. All of them are citing that there's a need.

And if you look beyond this minutia of the data and the details and step back, and if you live in that community, where a minute counts, you want to really put yourself in their shoes and figure it out, whether this program is viable or needed or not.

Our program is supported by one of the best programs that the State of Connecticut has to offer, which is Hartford Hospital's program, so it is not a community program. It is in a hand, partnership, hand-holding with them, and it's going to be an absolutely robust program, and I personally stand behind that.

Financially speaking, we've gone through

capital investment, operational investment, etcetera, and there are two schools of thought; whether we will increase the cost, or whether we'll increase the access, whether we'll increase the bottom line, or whether we'll erode someone else's market share.

I look at this as beyond those arguments. While we can afford it, Backus Hospital has committed as a not-for-profit organization to invest in both prevention, as well as intervention, and this is to demonstrate that we're going to do that fully for the population that we serve up and down 395 in the East Region.

So I recommend, urge and encourage OHCA to approve the application that is in front of you. It's for very critical life-saving care that our patients in the East Region need or the population in the East Region needs. Muscle health counts by minutes, and we want to make sure that we intervene in a timely manner.

No hospital, I repeat, no hospital, including L & M Hospital or any other, would be grossly impacted, because this is a delta in the need. It is not about market share grabbing from one to fulfill the other when you sit back and understand what's going on in that vast 1,000 square mile area of Eastern Connecticut.

So approving this application would satisfy this unmet need for patients and will bring the standard of care of angioplasty that does not exist today.

Backus Hospital is fully capable in the East Region to provide the services, improve access, decrease the cost, because moving patients from location-to-location adds up costs, and, most importantly, it will be timely intervention that is much needed today.

So on behalf of Eastern Connecticut and the large population that lives in there that do not have the same access that the rest of Connecticut does, I ask that this appeal, this application be reviewed and approved, and I would urge you to do that. Thank you.

MR. COHEN: Thank you, Bimal. Hearing Officer Hansted and OHCA staff, thank you for your time, your openness to our proposal, and, most importantly, your patience over the two full days of hearings.

As OHCA has said repeatedly in other decisions, CON applications are decided on a case-by-case basis and do not lend themselves to general applicability, due to the uniqueness of facts in each case.

OHCA must consider the factors set forth

in the Connecticut General statutes. As you know, Title 19a, Section 639a. Each of the criteria used by OHCA in evaluating CON applications has been met through our application, our completeness responses, our pre-filed testimony, and our testimony over the two days of hearings.

OHCA and the Intervenors have probed and pressed our witnesses on a wide variety of topics related to the application and our other filings. Let me just highlight a few of the factors that you consider in reviewing a CON application and how we've met them.

First, public need. We've clearly demonstrated a public need for this proposal. There is, as we've testified and as it's shown in our application, an unmet significant need in the isolated part of this state. There's much in the angioplasty region. There's higher coronary disease, higher STEMIs, cardiac incidents, and much lower, 20 percent, approximately 20 percent lower than the rest of the state with regard to PCIs and 41 percent lower than the national rates. Now isn't that really just the definition of need?

The Backus angioplasty region is a community that is not part of the L & M service area. As you've seen from our testimony, three percent of the

inpatient data, discharge data from the Backus angioplasty region use L & M Hospital. This proposal will improve access to these life-saving services for the 230,000 individuals in our region, and 160,000 of them will have the life-saving services within 30 minutes.

The next criteria is unnecessary duplication of services and impact on the diversity of health care providers and patient choice.

We've demonstrated that we will not duplicate services. As I said, L & M does not provide services in this region. We've demonstrated a minimal impact on L & M, with a larger impact on Hartford Hospital and other large providers, where this proposed program will not have any impact on their volume or quality. This program will significantly improve patient choice to a vast isolated underserved population.

Finally, let me say a few words about L & M's primary argument, that this program will take significant volume from L & M, thus affecting L & M's quality.

We have shown through real data that our program will not impact L & M's PCI program in any way, and one of the tasks that you have as OHCA is to weigh these minimal impacts against the tremendous improvement

in access for the vast majority of the 230,000 underserved folks in the Backus angioplasty region.

As we've talked about, Yale receives over 125 annual, annually over 125 PCIs from the L & M service area. Our minimal impact can easily be offset by L & M slightly increasing their share of these procedures.

There's only one program east of the river, the Connecticut River. We need to do better and to provide these life-saving procedures to this population with a clear unmet need and provide the same standard of care that other residents of Connecticut enjoy.

DR. CAMBI: I can go? Thanks, guys, for allowing me the opportunity to speak to you again today and make a few closing comments.

I will refer the panel back to my pre-filed testimony and, also, the robust discussion we've already had here today. My intent is not to be repetitive, but to highlight some key themes and flesh out some additional points that went unsaid.

Throughout all the pre-filed testimony, oral arguments and hearing discussion, the panel has heard a great deal of information about statistics, drive times, zip codes, finances, losses and other data.

I would like to, in the end, refocus the discussion on what's most important here, and that's patient care.

As cardiologists, physicians, in general, nurses, health care workers and leaders in the field, as most of us are in the room, we are charged with providing the best care possible in the safest manner possible while keeping in mind what's best for the overall health care of the region and the system of health care delivery as a whole. Undoubtedly, a daunting task.

When it comes to the ideal treatment of coronary artery disease, as you've heard today, the first distinction that must be made is between heart attack, STEMI, and stable coronary artery disease.

Heart attack, as you know and as you've heard, is a life-threatening emergency, caused by a completely obstructed artery that must be dealt with rapidly to minimize the chance of permanent heart damage or death.

Stable coronary artery disease, on the other hand, gives providers the luxury of time to plan out and execute optimal treatment strategies, which may include PCI, but may just mean medications, bypass surgery, or a combination of the like.

Patients with stable coronary artery disease undergoing an elective PCI are not dying of a heart attack. They are stable, the procedure is scheduled, and patients can travel to care right now within a reasonable time frame for treatment at any number of existing high-quality providers in New London, Hartford, Worcester, Providence, New Haven, Norwich, Springfield, etcetera.

Percutaneous Coronary Intervention, or PCI, stenting for the emergency treatment of heart attack is the central issue we should be focusing on when discussing the establishment of a novel PCI program.

Although the same procedure of PCI can be used in the treatment of stable coronary disease, it should not even be considered in a center that has not yet developed a safe, effective, high-quality emergent Percutaneous Coronary Intervention program.

Until you have demonstrated the capability to care for critically-ill heart patients in life-threatening situations, you cannot reasonably expect patients to put their trust in you to treat stable, non-emergent, non-life-threatening disease.

What if something went wrong? What if there were complications? You would be putting these

patients at risk before you've demonstrated you are equipped to handle coronary artery disease in its emergent state, so let us put aside Backus' application for elective PCI, where treatment times are irrelevant, and just talk about their application to develop an emergency PCI program.

It is true that immediate restoration of normal blood flow to a heart muscle that has a completely block artery is the ideal treatment for heart attack.

It is also true the ideal way to restore blood flow in these situations is by delivering a stent to open up the blocked artery compared with delivering IV medication, as you've heard; fibrinolytics, clot busters, thrombolytics that can dissolve the obstruction.

This only holds true providing the stent can be delivered in a timely fashion. National standards say less than 120 minutes when it's an inter-facility transfer. We've talked about that a lot today.

The challenge is that it takes a great deal of expertise to learn how to do this in a safe and effective way, not just expertise of the treating interventional cardiologist, but, also, the expertise of the nurses, the technologists, who support the physician.

Furthermore, it takes the expertise of

supporting personnel, including vascular surgeons, neurologists, neurosurgeons on site, should complications arise. Does Backus Hospital have a neurosurgeon or neurologist on site? Does Backus Hospital have a vascular surgeon on their medical staff?

The resources required to establish such centers are vast; time, capital, personnel. It is impractical to have an emergency PCI center in every town or every other town, and, so, we are left with a dilemma.

We know time is muscle and that opening a blocked artery as soon as possible is critically important for our patients, but establishing PCI centers in every town is not possible, so, to help, leaders in our field have developed guidelines and recommendations to help plan for the most effective allocation of limited resources that maximizes patient outcomes.

Panels of experts from groups, like the AHA, American College of Cardiology and SCAI, have poured over the thousands of studies from the scientific community and provide us an invaluable resource when considering applications like the one before this panel.

It’s clear from their recommendations that two emergency PCI centers within 30 minutes of each other are redundant. They go on to say multiple low volume and

partial service PCI centers within a geographic area diffuse PCI expertise, increase costs for the overall health care system, and have not been shown to improve access.

The Applicants claim that, despite these recommendations from national and statewide health care leaders, this region of our state is somehow special and in need of additional PCI center, has a large population that is being underserved and not getting ideal treatment for heart attack.

They claim that their desire for such a program is not for financial gain or capture greater market share, but to help these patients in need get appropriate care.

I disagree on all counts, and here's why. For eight years, L & M Hospital has run a primary PCI program for heart attack. It is a mere 21-minute drive time from Backus Hospital.

As the panel has heard, less than a handful of patients were transferred from Backus to our center for immediate treatment of their heart attack.

It was only in the case of a record-breaking snowstorm and in one other case, because a treating ER doc had the courage to tell me, quote,

"Politics be damned. I'm sending this guy to you." He was a young attorney, who had sustained cardiac arrest while waterskiing and was being called out of this world, and he sent him to me, we took care of it, and the patient did fine.

Instead, the vast majority of patients have been sent to tertiary care centers, like Hartford, with a median door-to-balloon time over the last five years of 134 minutes.

This information was provided by the Applicant in graphic form on page 26 of the 3D assessment. Contrary to their assertion, that this time is improving, a closer look at this graph reveals that, since 2014, median times are in the 150 to 200-minute range.

I need to highlight that all these times are well above the guideline recommended threshold of 120 minutes for patients transferred to another facility.

In fact, the guidelines would recommend that these patients would have fared better if they had received thrombolytics, clot busters, rather than delayed PCI and long door-to-balloon times, as they currently receive now.

I would also just point out that when my

colleague was speaking about that graph, he suggested that many of those numbers are outliers. Well, when we look at these metrics, people, who have a good reason for a delay in their PCI, old patients, patients, who can't provide consent, patients, who have ongoing other critical illnesses, drop out of the metric, so I would suggest that these patients are, indeed, the ones we need to be paying attention to.

The guidelines would go on to point out that these same patients would have done even better if they had been transferred to Lawrence & Memorial Hospital, the nearest PCI center.

Why do I say that? Because we already received transfers from outside hospitals that are farther away than Backus' 21-minute drive time from our facility. L & M's median door-to-balloon time in these patients is less than 90 minutes, better than the required 120 for inter-facility transfers, certainly better than the data presented on patients transferred from Backus to Hartford and even better than the national standard of less than 90 minutes for patients presenting directly to a PCI center through the ER.

So although I agree that there are patients that have not received ideal care for their

STEMI, I disagree wholeheartedly with the cause and the Applicant's proposed solution. The cause is clearly because these patients have not been transferred to the nearest PCI center in L & M. The solution is to compel providers to do so.

So what, then, is the answer to improve outcomes of our patients' cardiac care in this region and to improve access to timely PCI?

It is certainly not to invest in a redundant center of Backus, but, rather, in improving infrastructure, the identification of STEMIs in the field, and mandating the transfer of eligible patients to the nearest PCI center, whether coming from pre-hospital or neighboring emergency rooms. As I said, Westerly Hospital has done this with great success.

The Applicant's response to the idea that patients should be transferred to the nearest PCI center is predictable and unfortunate. They suggest that a driving force in their current practice pattern is because of patient and physician referral patterns, as well as hospital affiliations.

I would like to take a minute to explore this. When someone is having a life-threatening emergency, referral patterns and patient preferences are

no longer an issue.

For example, let's say I was in Hartford with my children at the Connecticut Science Museum, went to a local clinic with chest pain on the way home, they identify a STEMI, I would expect to be brought to the nearest capable PCI center. I would not expect that the emergency room doc would get on the phone to track down my PCP in Branford, find out what cardiologist he would refer me to, and then have the ER doc reach out to that cardiology group and arrange transfer down to New Haven.

The notion, that the Applicant's emergency room takes the time, when someone is having a sudden heart attack, to track down their primary provider or cardiologist, to find out what their preference is, or ask the patient, who is in critical condition, where they would like to go, is inconceivable and not standard of care.

I would go so far as to say it's an injustice to patients to weigh affiliations and market share above the best course of treatment.

Another consequence of establishing a redundant PCI center is not immediately obvious and is one I would like to now turn your attention.

There is a clear association between

volume and quality. That is to say higher volume centers have better outcomes and lower complication rates. For the last eight years, L & M has established a PCI center for emergency PCI. We treat over 100 acute MIs each year, which is on par with the volume of acute MIs that come in through the doors of Yale-New Haven Hospital's ER.

We have a very low complication rate and have a proven track record of high quality care. We have also demonstrated that we have additional capacity to handle transfers from other non-PCI centers.

Approving the development of a new center in such close proximity to ours will undoubtedly impact our volume and, consequently, our quality.

You've heard that, in fiscal year '15, 35 cases would be lost. That sounds like a small number, but when you're talking about a low volume institution, its impact is significant.

We have been steadily improving each year to try to reach this quality metric of 200 cases. If the Backus program were to be approved, we would almost certainly be prevented from reaching this quality standard.

While L & M's program would suffer from

declining volumes, I also have great concerns about the projected volumes the Applicant anticipates for their proposed program.

On page 1466 of their completeness responses, the Applicant suggests that all the cases currently leaving their hospital for Hartford would be treated with PCI on site at Backus, should their application be approved.

This is simply untrue and reveals a fundamental lack of understanding about performing elective PCI at centers without surgical backup.

The guidelines tell us that the most appropriate patients to have their elective procedures done at an offsite center should be low-risk patients with low-risk lesions.

In our experience at L & M, this is less than 75 percent of patients, who are found to have a lesion that requires PCI. Other patients remain appropriate to have their PCI procedures done at tertiary care centers.

Furthermore, and this is important, in our experience, roughly 15 percent of our entire diagnostic cath lab volume, which is over 600 cases, has a PCI performed at L & M.

Applying this formula to Backus' fiscal year '15 cath lab volume of 234 cases, which, by the way, is below the minimum threshold to even have a diagnostic cath lab, would result in 35 elective cases per year, numbers well below standards.

Another cohort of patients that Backus mistakenly assumes can exclusively be treated with PCI at their hospital are those patients, who sustain a non-STEMI. The truth is that many of these patients will not need PCI at all, but instead need medical therapy, or bypass surgery, or are having a non-STEMI for reasons other than an obstructed artery.

If PCI is indicated, many will be better served receiving their PCI at a tertiary care center for reasons stated above.

And, so, volume is the key issue in this application, both the certain reduction in volume at L & M Hospital, which will lead undoubtedly to a diminution in quality; like the old adage says, practice makes perfect, as well, what will certainly be lower than anticipated volumes at Backus.

We are left, then, should this program be approved, with exactly what the guidelines warn against; two low-volume redundant centers, with substandard

quality, causing significant financial strain and drain on the health care system of our region.

Before I finish, I would like to appeal to this panel to consider what might be the best way to improve the quality of care delivered to patients with coronary artery disease suffering acute heart attack.

I would urge you to put your resources not into a redundant expensive program that stands to reduce quality, but, rather, into education, equipment, EMS personnel and executive mandates that help identify earlier recognition of STEMI in the pre-hospital arena and facilitate expeditious transfer of these critically-ill patients to the nearest PCI center, be they in Hartford, Massachusetts, Rhode Island, or New London.

I thank you all so much for your time, attention, and allowing me the opportunity to speak today.

HEARING OFFICER HANSTED: Okay, thank you, everyone. Just one point of housekeeping. The late files that were ordered will be due on June 21st. Does that give you enough time? Okay.

Before we adjourn, is there anyone here, who would like to give public comment on the matter before us?

Hearing and seeing no one, I will adjourn this hearing. Thank you, everyone.

(Whereupon, the hearing adjourned at 3:00 p.m.)

Re: Docket No. 15-32031-CON – Late File 2 & 3

Dear Ms. Martone:

On behalf of Hartford Hospital and The William W. Backus Hospital (the "Applicants"), enclosed for filing is the information requested of the Applicants during the second part of the Public Hearing (June 14, 2016) on this docket.

Very truly yours,

BROWN RUDNICK LLP

STATE OF CONNECTICUT
DEPARTMENT OF PUBLIC HEALTH
OFFICE OF HEALTH CARE ACCESS

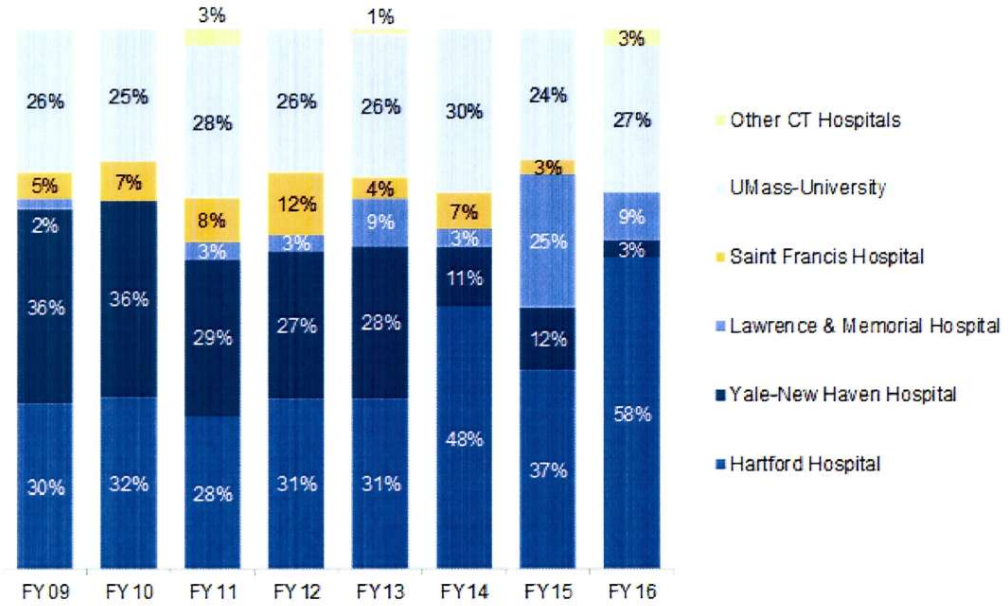
IN RE: THE WILLIAM W. BACKUS HOSPITAL AND HARTFORD HOSPITAL'S CERTIFICATE OF NEED APPLICATION TO ESTABLISH A PRIMARY AND ELECTIVE PERCUTANEOUS CORONARY INTERVENTION PROGRAM AT BACKUS HOSPITAL	:	**DOCKET NO. 15-32031-CON**
	:	**June 21, 2016**

THE WILLIAM W. BACKUS HOSPITAL AND HARTFORD HOSPITAL'S LATE FILE No. 2 & No. 3

At the June 14, 2016 public hearing in this docket, The William W. Backus Hospital and Hartford Hospital (the "Applicants") were asked to update the data contained in the Pre-Filed Testimony of M. Shane Foreman on page 1516 (Late File No. 2) and the data contained in the CON, Figure 20 on page 62 (Late File No. 3). The updated data follows.

Applicants' Response for Late File No. 2 (page 1516)[1]:

Service Area Primary PCI Market Share Trend



- Hartford Hospital currently treats the most Primary PCI patients originating within the service area.

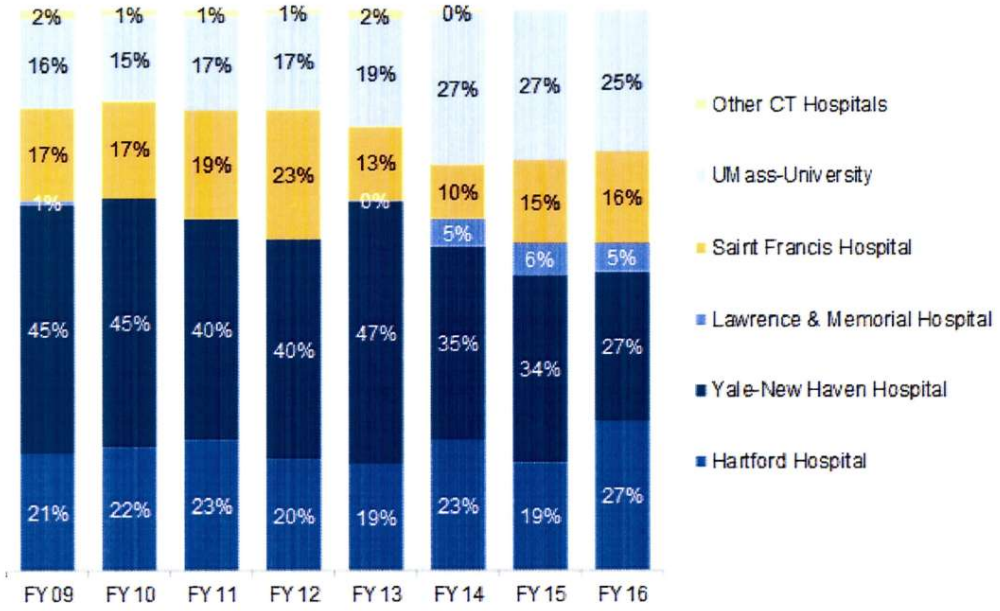
Source: CHIME; State of Massachusetts; 3d Health Analysis

The percentage of residents of the Backus Angioplasty Region seeking care at Hartford Hospital for Primary PCI has increased 28% since FY 2009. From FY 2014-FY2016 Hartford Hospital treated an average of 48% of Primary PCI cases from the Angioplasty Region, with 58% of cases choosing Hartford Hospital for this service in FY2016 (through April). Yale New Haven treated 12% of Primary PCI cases in FY 2015 and only 3% of Angioplasty Region Primary PCI cases in FY 2016 (through April). St. Francis treats a very small percentage of the Angioplasty Region (3% in FY2015), and through April of FY2016 has provided no Primary PCIs to the residents of the Angioplasty Region. Since FY 2011, Lawrence and Memorial treated an average of 8.6% Primary PCI patients from the Angioplasty Region. These numbers, however, are quite variable. For example, in FY 2014 Lawrence and Memorial treated only 3% of Primary PCI patients from the Angioplasty Region, in FY2015 Lawrence and Memorial treated 25% of cases from within the Angioplasty Region, and in FY 2016 (April) Lawrence and Memorial treated 9%

[1] *Connecticut Hospital data for both charts derived from CHIME data. Fiscal Year 2015 represents a full year, October-September 2015. Fiscal Year 2016 is current through Quarters 1 and 2 (October – April 2016). Data represents the percentage of Primary or Elective PCI procedures in patients originating from the defined Backus Angioplasty Region by Hospital.*

of Primary PCIs originating from the Angioplasty Region. In FY 2016 27% of Angioplasty Region residents were forced to leave the State of Connecticut to seek this life saving standard of care. Establishing a program at Backus Hospital would improve access to this standard of care for the 231,419 residents of the Angioplasty Region, 69% who do not have access within a 30 minute drive time today.

Service Area Elective PCI Market Share Trend



- Over half of the service area Elective PCI patients are currently having to travel to either Hartford Hospital or Yale-New Haven Hospital.

Source: CHIME; State of Massachusetts; CHA Patient Census Reports; 3d Health Analysis

From FY 2009 to FY 2016 (through April) the percentage of Elective PCI patients originating from the Angioplasty Region treated by Hartford Hospital increased by 6%. In FY 2015 Hartford Hospital treated 19% of Elective PCI cases from the Angioplasty Region, growing to 27% in FY 2016 (through April). Yale New Haven Hospital's share of the Elective PCI cases originating from the Angioplasty Region decreased 18% from FY 2009-FY 2016. St. Francis treats an average of 16.25% of Elective PCI cases from the Angioplasty Region, and in FY 2015 as well as in FY 2016 (through April) St. Francis treated 15% and 16% of patients, respectively. Lawrence and Memorial Hospital has treated 5-6% of Elective cases originating from the Angioplasty Region since 2014. The remaining cases seek care out of State. Establishing care close to home for patients requiring Elective PCI services will improve the quality of life within the Angioplasty Region. These patients choose Hartford HealthCare providers more than any

other provider in the State for their care, as articulated on page 36 of the CON application. Establishing an Elective program at Backus through the Hartford HealthCare IIeart and Vascular Institute will bring experienced, world class physicians to the residents of rural North East Connecticut. Patients suffering from NSTEMI, Left Bundled Branch Blockages, and Unstable Angina will no longer have to be transferred or travel far distances to unfamiliar cities and facilities to receive their procedures. Residents of the Angioplasty Region will enjoy the same standard of care as the rest of the State of Connecticut (page 1448) if this service is established at Backus Hospital.

Applicants' Response for Late File No. 3 (page 62):

Figure 20 – Backus Hospital Diagnostic Catheterization Volume and Related Transfers

Fiscal Year	***Total Diagnostic Catheterizations***	***Transfers***	***% Transferred***
2012	*316*	*90*	*28.4%*
2013	*356*	*90*	*25.3%*
2014	*218*	*55*	*25.2%*
2015 - Actual	*237*	*46*	*19.4%*
2016 – Annualized	***230***	***33***	***14.3%***
5 Year Average	***271***	***63***	***23.2%%***

Over the past 4 years Backus has transferred out an average of 63 diagnostic catheterization patients each year, which equates to approximately 23% of annual procedures. These patients then undergo a repeat catheterization to clear the blockages found in the initial procedure. Often this requires another groin or radial puncture to the patient, and transfer via EMS, which can increase risk of bleeding, infection, and other complications. These patients are treated at a tertiary care institution by an unfamiliar care team. Stress and anxiety are increased for families and caregivers, and accessing appropriate follow up care, or other necessary related services, back in the patient's home community can be difficult. By establishing an Elective PCI program at Backus, patients will be able to have the diagnostic and elective procedure completed together, which will reduce costs to the system and patient, reduce the exposure to radiation and intravenous contrast used during the procedure, reduce the risk of bleeding and infection, reduce the stress and anxiety placed on the patient and family, reduce duplication of effort and cost to the health care system and improve the care coordination offered to residents of the Angioplasty Region.

RE: Certificate of Need Application; Docket Number: 15-32031-CON
Establishment of Angioplasty Program at William W. Backus Hospital
Closure of Public Hearing

Dear Mr. Cohen and Ms. Volpe:

Please be advised, by way of this letter, the public hearing held on March 23 and June 4, 2016 in the above referenced matter is hereby closed as of June 22, 2016. OHCA will receive no additional public comments or filings.

If you have any questions regarding this matter, please feel free to contact Jessica Schaeffer-Helmecki at (860) 509-8075, Olga Armah at (860) 418-7070, or David Fernandes at (860) 418-7032.

Sincerely,

Kevin T. Hansted

Proposed Final Decision

Applicants:

The William W. Backus Hospital
326 Washington Street,
Norwich, CT 06360

Hartford Hospital
80 Seymour Street,
Hartford, CT 06102

Docket Number: **15-32031-CON**

Project Title: **Establishment of a Primary and Elective Percutaneous Coronary Intervention Program at Backus Hospital without On-Site Surgical Backup**

Project Description: The William W. Backus Hospital ("Backus") and Hartford Hospital ("Hartford") (Backus and Hartford are herein collectively referred to as the "Applicants") seek authorization to establish and operate a primary and elective percutaneous coronary intervention ("PCI" or angioplasty) program at Backus without on-site cardiac surgical backup, at an associated capital cost of $4,982,053.

Procedural History: The Applicants published notice of their intent to file a Certificate of Need ("CON") application in *The Bulletin* (Norwich) on September 7, 8 and 9, 2015. On September 30, 2015, the Office of Health Care Access ("OHCA") received the CON application from the Applicants for the above-referenced project. On January 29, 2016, OHCA deemed the application complete.

On March 9, 2016, the Applicants were notified of the date, time, and place of the public hearing. On February 11, 2016, a notice to the public announcing the hearing was published in *The Bulletin* (Norwich). Thereafter, pursuant to Connecticut General Statutes ("Conn. Gen.

Keeping Connecticut Healthy
DPH
Connecticut Department of Public Health

Phone: (860) 418-7001 • Fax: (860) 418-7053
410 Capitol Avenue, MS#13HCA
Hartford, Connecticut 06134-0308
www.ct.gov/dph
Affirmative Action/Equal Opportunity Employer

Stat.") § 19a-639a(f)(2), the public hearing regarding the CON application was held on March 23, 2016 and continued on June 14, 2016.

Commissioner Pino designated Attorney Kevin T. Hansted as the hearing officer in this matter. The hearing was conducted in accordance with the provisions of the Uniform-Administrative Procedure Act (Chapter 54 of the General Statutes) and Conn. Gen. Stat. § 19a-639a(f)(2).

On March 16, 2016, Lawrence + Memorial Hospital ("L+M") filed a petition requesting intervenor status. L+M was granted intervenor status with full rights in this matter on March 17, 2016.

On March 22, 2016 the Applicants filed a Motion in Limine to preclude use of data regarding out-of-state PCI providers. On March 23, 2016 L+M filed an objection to the Applicants' Motion in Limine. On March 31, 2016, Hearing Officer Hansted denied the Applicants' motion and sustained L+M's objection. The public hearing record was closed on June 22, 2016.

Findings of Fact

1. Backus is a 233-bed/bassinet acute care hospital, located at 326 Washington Street in Norwich, CT, and is affiliated with Hartford. Exhibit A, p. 13.

2. Hartford is an 867-bed major teaching hospital affiliated with the University of Connecticut School of Medicine and a regional referral center serving New England. Hartford's Henry Low Heart Center is a full service cardiac provider that offers the following services:
   a. Cardiac catheterization, angioplasty, electrophysiology and rehabilitation programs;
   b. A congestive heart disease center;
   c. Echocardiography;
   d. Extracorporeal membrane oxygenation;
   e. A heart failure infusion program;
   f. Heart surgery and transplants;
   g. Nuclear cardiology; and
   h. A transcatheter aortic valve replacement program.

   Exhibit A, p. 13, 24.

3. Backus currently offers the following inpatient and outpatient cardiac services:
   a. Diagnostic cardiac catheterizations;
   b. Pacemaker insertions, evaluations and follow-ups;
   c. Implantable cardiac defibrillator insertions, evaluations and follow-ups;
   d. Stress testing;
   e. Nuclear cardiac imaging;
   f. Cardiac imaging services;
   g. Echocardiology;
   h. 24- and 48-hour monitoring;
   i. ECG testing;
   j. Electrical cardioversions;
   k. Intra-aortic balloon pumping;
   l. Vascular surgical services offered by interventional radiology staff such as peripheral angioplasty and stenting;
   m. Heart failure program that offers monitoring and a program coordinator for patients beyond the inpatient setting; and
   n. Three phase cardiac rehabilitation program consisting of inpatient, outpatient and outpatient maintenance.

   Exhibit A, p. 20-21.

4. The Applicants are proposing the expansion of cardiac services at Backus by establishing and operating a primary and an elective PCI program without on-site cardiac surgical back-up. Backus' 12-bed critical care unit would be the primary unit for all post-PCI patients. Exhibit A, pp. 13, 21.

5. Angioplasty is an interventional procedure whereby a catheter, usually inserted into an artery in the groin, is threaded through the circulatory system to a diagnosed blockage in the heart. An expandable balloon is passed through the artery and inflated, flattening blockage-causing plaque and allowing for improved blood-flow. Exhibit A, p. 14.

6. Primary PCI is used to treat emergency situations, such as ST-Segment Elevation Myocardial Infarctions ("STEMI"), which occur when an acute coronary thrombosis blocks a coronary artery. Elective PCI is often a scheduled procedure following extensive cardiac testing or a post-cardiac event to relieve chest pain and related symptoms. Exhibit A, p. 14.

7. STEMI patients requiring primary PCI, need the most urgent care and are treated on an emergency basis. Elective PCI procedures for patients with non-ST-segment elevation myocardial infarction ("NSTEMI") are often scheduled, but ideally take place within 24-48 hours of diagnosis, effectively reducing the risk of future cardiac events. Ex. A, pp. 14-15; Ex. BB, Transcript, Dr. Francis J. Kiernan, Director of Cardiac Laboratory, Hartford Hospital, pp. 103-104.

8. Hartford provides comprehensive cardiac services and performs more than 1,000 angioplasties annually. Hartford and Backus have entered into an agreement for the emergency transfer of patients to Hartford for off-site surgical backup for urgent cases at all hours and for elective cases at mutually agreed upon hours, as well as the necessary training and oversight of the proposed PCI program at Backus. Ex. A, pp. 46, 99, 892-93.

9. The Applicants submitted the following agreements, policies and protocols:
   - Primary PCI Patient Selection Guidelines
   - 2011 ACCF/AHA/SCAI Guidelines for Percutaneous Coronary Intervention and How Backus Will Meet the Standards
   - Elective PCI Patient Selection Guide
   - Transfer Protocol and Agreement between the Applicants
   - Cardiac Surgery Transfer Agreement Between Hartford and Backus
   - Clinical Guidelines for Transfer of Catheterization Lab Patients to Acute Care Facility

   Ex. A. pp. 88, 84-87, 89, 892-897

10. The Applicants claim benefits of the proposal include:
    a. Improved access for an area of the state that:
       (i) is "geographically isolated" from the nearest PCI provider;
       (ii) has an older population with a relatively higher risk than the state for coronary artery disease;
       (iii) has current rates of emergency/primary and elective PCI interventions for residents that are significantly below state and national levels leading to relatively higher rates of morbidity and mortality;
    b. Minimized out-of-pocket costs associated with second hospital admission and duplicative procedures; and

c. Improved future care coordination and management for patients with heart conditions.

Exhibit A, p. 13.

11. The ACC/AHA STEMI Guidelines provide that "door-to-balloon" time, measured from the time a patient presents at the emergency department of a PCI-capable hospital to the time a balloon is inflated to open the occluded artery, should not exceed 90 minutes. The recommended door-to-balloon time for patients presenting at a non-PCI capable hospital from which the patient must be transferred to another hospital is 120 minutes. Exhibit A, pp. 47, 500.

12. The presence of a PCI program on-site at Backus would obviate the need for revascularization following a cardiac catheterization diagnosis, enabling the diagnostic and elective procedure to be completed together. This would reduce patient exposure to radiation and intravenous contrast used during the procedure. Ex. A, p. 62.

13. The Statewide Health Care Facilities and Services Plan states that hospitals seeking to establish an elective PCI program without on-site cardiac surgery must:
    a. Meet the conditions required in the American College of Cardiology Foundation/American Health Association/Society for Cardiovascular Angiography and Interventions ("ACCF/AHA/SCAI) Practice Guideline (the " Guideline") for percutaneous coronary intervention without on-site surgical backup; and
    b. Demonstrate a clear public need for the program. Specifically, the Guideline indicates that it is only appropriate to consider the initiation of the PCI program without on-site cardiac surgical backup if this program will clearly fill a void in the healthcare needs of the community as competition with another PCI program in the same geographic area may not be in the best interests of the community.

    Exhibit A, pp. 38-39, 47.

14. The Applicants' proposed service area ("proposed service area") included a) towns within a 30 minute drive-time to Backus, and b) towns outside of the 30-minute radius but for which Backus would be the closest PCI-capable facility in Connecticut. This classification excluded out-of-state PCI providers.

TABLE 1
APPLICANTS' PROPOSED SERVICE AREA

Towns within a 30-minute drive time of Backus Hospital			Towns for which Backus would be the closest in-state PCI provider
Bozrah	Killingly	Preston	East Haddam
Brooklyn	Griswold-Lisbon	Scotland	Hampton
Canterbury	Hebron	Sprague	Pomfret
Chaplin	Killingly	Sterling	Putnam
Colchester	Mansfield Center	Voluntown	Thompson
Columbia	Norwich	Windham	Woodstock
Franklin	Plainfield		

Exhibit A, p. 35.

15. Based on fiscal year ("FY") 2015 inpatient discharges for Backus, the towns below comprise Backus' service area ("SA").[1] The Applicants' proposed service area included 20 towns beyond Backus Hospital's SA (Bozrah, Brooklyn, Columbia, Franklin, Hebron, Killingly, Lebanon, Mansfield Center, Scotland, Sprague, Sterling, Voluntown, Windham, East Haddam, Hampton, Pomfret, Putnam, Thompson and Woodstock). Additionally, the proposed service area omitted three towns that are in the SA (Groton, Ledyard and Montville).

TABLE 2
BACKUS HOSPITAL DISCHARGES, FY 2015

Patient Town	Discharges	% of Total Discharges	Cumulative %
Norwich	3,729	35%	35%
Griswold- Lisbon	1,169	11%	46%
Montville	910	8%	54%
Plainfield	843	8%	62%
Preston	346	3%	65%
Colchester	322	3%	68%
Canterbury	273	3%	71%
Ledyard	269	3%	73%
Groton	251	2%	76%
Remaining Towns/States	2,611	24%	100%
Total	**10,723**	**100%**	**100%**

Source: CT DPH, Office of Health Care Access Acute Care Discharge Database

16. The Applicants stated that they selected drive time as the basis for the proposed service area because of the "urgency of time, in order to access [PCI] services." Additionally, they stated that they selected 30 minutes as the perimeter of the drive time based on the Department of Public Health Office of Emergency Management Services, *Connecticut EMS STEMI Guidelines* ("DPH OEMS Guidelines"). Ex. T, Transcript, Mr. M. Shane Foreman, CEO, 3d Health, p. 34; Ex. K, Pre-filed Testimony, Foreman, 1543.

17. The stated goal of the DPH OEMS Guidelines is to "ensure that authorized EMS personnel obtain a 12-lead electrocardiogram in the field on all patients with suspected MI, thereby increasing the likelihood they will be transported for treatment with PCI intervention within 90 minutes of first medical contact." It directs emergency medical vehicles transporting a patient already identified as STEMI to bring the patient to a PCI-capable facility if it is less than 30 minutes away. It also states that emergency vehicles

1. SA is defined as towns that make up the top 75% of a hospital's discharges. CT DPH, *Statewide Health Care Facilities Plan* 76 (2014 Supplement.).

should be 12-lead echocardiogram-equipped to facilitate early identification of STEMI patients. Ex. A, p. 969-970.

18. There are proven beneficial outcomes associated with reducing the time between a patient's presentation at the emergency department to inflation of the balloon to open the occluded artery ("door-to-balloon time") during a primary PCI procedure. Ex. T, Transcript, Dr. Paul Thompson, Chief of Cardiology, Hartford Hospital, p. 29.

19. From 2011 through 2015, Backus' median door to balloon time for primary PCI was 134 minutes. Transport time to a PCI-capable hospital accounted for the largest portion of the door-to-balloon time. Ex. A, p. 473, 476.

20. Backus has historically transferred patients to Hartford and Yale New Haven Hospital for primary PCI, transferring only three patients in the past to the closest PCI-provider, L+M. The Applicants stated this was due primarily to referral patterns. Ex. T, Transcript, Dr. Kyle McClaine, EMS Director, Backus Hospital, p. 151-152; Ex. BB, Transcript, Dr. John Foley, Director of Cardiovascular Service Line, Hartford Medical Group, p. 138.

21. UMass Memorial Medical Center ("UMass") submitted a letter stating that it has an ongoing relationship with Day Kimball Hospital ("Day Kimball") and established protocols are in place for receiving NSTEMI transfer patients from Day Kimball. It also states that UMass' PCI program currently has capacity to continue treating transfers and referrals from Day Kimball. Ex. V; pp. 1-2.

22. UMass is the closest existing PCI provider, based on travel time, for four out of the six towns in northeast Connecticut the Applicants included in their proposed service area.

TABLE 3
TRAVEL TIMES FROM NORTHEAST TOWNS INCLUDED IN THE PROPOSED SERVICE AREA TO CLOSEST HOSPITAL*

Select Towns	Drive time to Backus Hospital	Drive time to UMass Hospital
East Haddam	27 minutes	78 minutes
Hampton	27 minutes	46 minutes
Pomfret	36 minutes	33 minutes
Putnam	33 minutes	26 minutes
Thompson	35 minutes	23 minutes
Woodstock	39 minutes	33 minutes

* Based on Google Maps travel time without traffic from center of town

23. Day Kimball, located at 320 Pomfret Street, Putnam, stated in its 2015 Community Health Needs Assessment and Implementation Plan that it "continues to work closely with UMass for STEMI patient transfers via Life Star helicopter within 90 minutes of

admission to the emergency department and meets regularly to review STEMI data." Ex. W, p. 4.

24. In 2010, towns in the proposed service area experienced an incidence rate of 104.3 STEMIs per 100,000; Connecticut overall experienced a rate of 83. Towns in the proposed service area experienced an incidence rate of 237.2 for NSTEMIs; Connecticut overall had a higher incidence of NSTEMIs at 242.3. Ex. A, p. 463.

25. Over a seven year period, patients in the proposed service area underwent fewer inpatient elective PCIs; declining from 316 in FY09 to 171 in FY15. This is consistent with state-wide trends. Ex. A, p. 466, 1499-1500.

26. The number of patients transferred for an elective PCI following a cardiac catheterization at Backus was 90 in 2012, 90 in 2013, 55 in 2014, 46 in 2015 and 33 in 2016 (annualized). The percentage of cardiac catheterization patients transferred from Backus to a PCI-capable facility also decreased, from 28.4% in 2012 to 19.4% in 2015. Ex. CC, p. 1570.

27. According to the SCAI/ACC/AHA's *Expert Consensus Document: 2014 Update on Percutaneous Coronary Intervention Without On-Site Surgical Backup* ("2014 Guidelines"), multiple factors have contributed to the decline in PCI procedures, including "a reduction in restenosis by drug-eluting stents, a greater emphasis on medical therapy for the treatment of stable coronary artery disease, enhanced primary and secondary prevention efforts, and a reduction in incidence of STEMI…" Ex. A, p. 113.

28. According to the Applicants, there are an insufficient number of emergency advanced life support vehicles in the Backus region, with 15 covering 13 towns in the Backus region. Ex. A., p. 34.

29. The 2014 Guidelines state that "an institutional volume threshold of <200 PCIs/year was associated with worse outcomes" and therefore "continued operation of laboratories performing <200 procedures annually that are not serving isolated or underserved populations be questioned." It continues to say that "multiple low-volume and partial service PCI centers within a geographic area diffuse PCI expertise, increase costs for the overall health system and have not been shown to improve access." It defines "geographic isolation" as a hospital that is more than 30 minutes away from a PCI-capable facility by emergency transport. Ex. A, pp. 119-121.

30. L+M, a PCI-capable facility, is located 17 miles, or 21 minutes from Backus. Ex. T, Transcript, Dr. Brian Cambi, Director of Cardiology, L+M Hospital, p. 51.

31. Based on historic PCI utilization of residents originating from Backus' SA at other area hospitals[1], the Applicants project Backus would perform 163 PCIs in FY16, increasing slightly to 169 in FY18.[2]

TABLE 4
PROJECTED PCI UTILIZATION AT BACKUS HOSPITAL

Category	FY16	FY 17	FY18
Primary PCI	55	54	54
Elective PCI	108	111	115
Total	**163**	**165**	**169**

[1] Includes Backus SA patients receiving PCIs at: Hartford Hospital, Yale New Haven, Saint Francis, John Dempsey, The Hospital of Central Connecticut, UMass Memorial and Lawrence + Memorial Hospital.

[2] Assumes a retention rate of 100% of patients receiving PCIs at Hartford Hospital and 36% from other hospitals based on Backus' ED market share.

Ex. K, p. 1497; Ex. E, pp. 1458, 1466.

32. There are no PCI providers in the Applicants' proposed service area. However, the following hospitals have administered PCIs to 369 patients originating from Backus' SA in 2015.

TABLE 5
2015 PCI PROVIDERS TREATING PATIENTS ORIGINATING FROM BACKUS' SA

PCI Providers	Distance from Backus[1]	No. of PCIs Originating from Backus SA	No. of PCIs	No. of PCIs minus No. from Backus SA	% of PCIs from Backus SA
Hartford Hospital	40 minutes	50	1,099	1,049	4.5%
Yale New Haven Hospital	53 minutes	145	1,575	1,430	9.2%
Saint Francis Hospital	39 minutes	24	784	760	3%

		L+M Total	**121**	**95**
		No. Remaining at L+M	**78**	**75**

* Outpatient elective PCI data unavailable

Ex. A, pp. 1499-1500; Ex. M, p. 12.; Compliance Reporting for Docket No. 12-31769

34. L+M stated that it has additional capacity to handle transfers from other non-PCI centers. Ex. BB, Transcript, Dr. Cambi, p. 158.

35. The 153 primary and elective PCI patients that would remain at L+M if Backus were to have a PCI program and capture all patients from its SA towns falls below the 200 level recommended by the 2014 Guidelines. Exhibit A, pp. 1499-1500.

36. The Applicants and L+M submitted conflicting claims as to the average retention rate of patients from a PCI provider's service area. The Applicants initially based their projection assumptions on an 80% retention rate of PCI patients from their proposed service area based on observed emergency department market share from the area. L+M asserted that those seeking scheduled elective PCIs would not mimic emergency room patterns and that L+M experienced an overall PCI retention rate of 54%. The Applicants then based final projection rates on a 100% retention rate for patients who had previously received PCIs at Hartford and 36% for those visiting all other hospitals. Ex. A, p. 489; Ex. BB, Testimony, Ms. Edwards, p. 139; Ex. BB, Testimony, Mr. Bitmal Patel, President of the East Region and Senior Vice President, Hartford HealthCare, p. 139; Ex. K, p. 197.

37. L+M established its elective PCI program in 2013. Per the Agreed Settlement with OHCA approving establishment of its program, L+M is expected to perform a quantity of procedures above those recommended by the 2014 Guidelines. L+M has stated it is likely to fall well below the minimum threshold should Backus initiate its own PCI program. Ex. M, p. 26; OHCA Docket Number 12-31768-CON.

38. Backus projects a financial loss from the operation of a PCI program with increasing incremental losses from operations, from FY2017 through FY2019.

TABLE 7
PROJECTED INCREMENTAL REVENUES AND EXPENSES

	FY 2017	FY 2018	FY 2019
Revenue from Operations*	$4,750,000	$4,911,295	$4,970,474
Total Operating Expenses**	$5,208,730	$5,470,996	$5,676,231
Gain/Loss from Operations	($457,817)	($559,701)	($705,757)

* Net revenue per case remains flat and assumes no increase in payer reimbursement
** 2.68% inflation rate applied over five resulting in increasing expenses; 2.6 new FTE cardiology staff, on-call payment and call back pay to staff, 24/7 on call physician expenses at $125/hr. Exhibit A, p. 1409; Ex. BB, Transcript, Ms. Janette Edwards, Backus Hospital, p. 128.

39. Backus would need to perform 385 PCI procedures in year five of the program to break even financially. The Applicants project they would perform 233 procedures in the year 2020. Ex. A, pp. 68, 70.

40. Estimated capital expenditures associated with the proposal are almost $5 million. Capital costs would support an additional catheterization lab, new software and equipment upgrades. An additional 3% of net patient revenues would be committed to ongoing capital needs. The Applicants' proposed capital expenditures are as follows:

TABLE 8
TOTAL PROPOSAL CAPITAL EXPENDITURES

Purchase/Lease	**Cost**
Equipment (Medical, Non-medical Imaging)	$344,000
Construction/Renovation	$4,500,000
Other (specify) (*estimated 3% of operating revenue for additional capital needs*)	$138,053
Total Capital Expenditure (TCE)	**$4,982,053**
Total Capital Cost (TCO)	**$0**
Total Project Cost (TCE+TCO)	**$4,982,053**

Exhibit A, pp. 67, 77.

41. The Applicants would fund the proposal through Backus' income from operations. Exhibit A, p. 65.

42. The Applicants project overall gains from Backus' operations from FY17 through FY19.

TABLE 9
BACKUS HOSPITAL PROJECTED REVENUES AND EXPENSES WITH CON

	FY 2017	FY 2018	FY 2019
Revenue from Operations	$308,297,624	$317,799,924	$329,208,612
Total Operating Expenses	$270,537,970	$276,777,162	$285,116,496
Gain/Loss from Operations	$37,759,653	$41,1022,761	$44,062,116

Exhibit A, p. 1409.

43. The projected patient population mix for the proposed PCI program is as follows:

TABLE 10
BACKUS HOSPITAL'S PROJECTED PAYER MIX

Payer	Projected**					
	FY 2016		FY 2017		FY 2018	
	Volume	%	Volume	%	Volume	%
Medicare*	109	50%	110	50%	113	50%
Medicaid*	25	11%	25	11%	26	11%

Total Payer Mix	**216**	**100%**	**218**	**100%**	**225**	**100%**

*Includes managed care activity
**Payor-weighted reimbursement by DRG based on the payor mix of all PCI patients originating from the proposed service area.
Ex. A, p. 1469

44. OHCA is currently in the process of establishing its policies and standards as regulations. Therefore, OHCA has not made any findings as to this proposal's relationship to any regulations yet to be adopted by OHCA. (Conn. Gen. Stat. § 19a-639(a)(1))

45. The CON application is inconsistent with the Statewide Health Care Facilities and Services Plan. (Conn. Gen. Stat. § 19a-639(a)(2))

46. The Applicants have not sufficiently demonstrated that there is a clear public need for the proposal. (Conn. Gen. Stat. § 19a-639(a)(3))

47. The Applicants have satisfactorily demonstrated that the proposal is financially feasible. (Conn. Gen. Stat. § 19a-639(a)(4))

48. The Applicants have not satisfactorily demonstrated that access to services, cost effectiveness and the quality of health care delivery would be maintained. (Conn. Gen. Stat. § 19a-639(a)(5))

49. The Applicants have satisfactorily shown that there will be no change in access to primary and elective PCI services to the relevant populations and payer mix, including Medicaid patients and indigent persons. (Conn. Gen. Stat. § 19a-639(a)(6))

50. The Applicants have not satisfactorily identified the population to be served or that this population has a need. (Conn. Gen. Stat. § 19a-639(a)(7))

51. The Applicants' historical utilization in the area does not support this proposal. (Conn. Gen. Stat. § 19a-639(a)(8))

52. The Applicants have not satisfactorily demonstrated that the proposal will not result in an unnecessary duplication of existing services in the area. (Conn. Gen. Stat. § 19a-639(a)(9))

53. The Applicants have satisfactorily demonstrated that the proposal would not result in a reduction or change in access to services for Medicaid recipients or indigent persons. (Conn. Gen. Stat. § 19a-639(a)(10))

54. The Applicants have satisfactorily demonstrated that the proposal would not negatively impact the diversity of PCI providers in the area. (Conn. Gen. Stat. § 19a-639(a)(11))

55. The Applicants have satisfactorily demonstrated that the proposal will not result in any consolidation that would affect health care costs or accessibility to care. (Conn. Gen. Stat. § 19a-639(a)(12))

Discussion

CON applications are decided on a case by case basis and do not lend themselves to general applicability due to the uniqueness of the facts in each case. In rendering its decision, OHCA considers the factors set forth in Conn. Gen. Stat. § 19a-639(a). The Applicant bears the burden of proof in this matter by a preponderance of the evidence. *Jones v. Connecticut Medical Examining Board, 309 Conn. 727 (2013).*

Backus is a 233-bed/bassinet acute care hospital, located at 326 Washington Street in Norwich, CT, and is affiliated with Hartford. *FF1.* Hartford is an 867-bed major teaching hospital affiliated with the University of Connecticut School of Medicine and a regional referral center serving New England. *FF2.* Backus currently offers inpatient and outpatient cardiac services including diagnostic cardiac catheterizations, cardiac imaging services, echocardiology, intra-aortic balloon pumping and vascular surgical services offered, such as peripheral angioplasty and stenting, by interventional radiology staff. *FF3.*

The Applicants are proposing to expand cardiac services at Backus to include a primary and an elective PCI program. *FF4.* Backus' 12-bed critical care unit would be the primary unit for all post-PCI patients. *FF4.* Hartford would provide off-site surgical back-up. *F8.* Hartford provides comprehensive cardiac services and performs more than 1,000 angioplasties annually and, in addition to tertiary back-up, would provide the necessary training and oversight of Backus' newly established PCI program. *FF8.*

<u>The Applicants have not satisfactorily identified the population to be served by the proposal</u>

Rather than basing the service area on Backus' inpatient discharges, the Applicants based the projected population to be served on a combination of a) towns within a 30-minute radius from Backus and b) towns for which Backus would be the closest PCI-provider by travel time. *FF14.* According to the Applicants, it selected drive time because of the "urgency of time, in order to access [PCI] service." The Applicants stated they selected 30 minutes as the perimeter of the drive time based on the DPH OEMS Guidelines. *FF16.*

The Applicants' proposed service area is inappropriate for three reasons. First, the Applicants failed to provide an adequate rationale for its selection of 30 minutes as the perimeter for the towns to be served. The stated goal of the DPH OEMS Guidelines is to "ensure that authorized EMS personnel obtain a 12-lead electrocardiogram in the field on all patients with suspected MI." It is intended to provide guidance to emergency transport vehicles as to what hospital patients who have a pre-hospital diagnosed STEMI should be directed. *FF17.* Although it is well established that the time to reperfusion correlates to the extent of heart muscle damage in a patient experiencing acute myocardial infarction ("AMI"), the Applicants provided no recognized standard that establishes that every town should be within 30 minutes of a PCI-

capable facility. The Applicants' basis for a 30 minute drive time standard misinterprets the standards and the purpose of the DPH OEMS Guidelines.

Second, for NSTEMI patients requiring an elective -- as opposed to primary -- angioplasty, timing is less critical. According to the Applicants, patients presenting with a one or more significant arterial blockages that are non-life threatening, or NSTEMI, should receive an elective angioplasty within 24 to 48 hours of being diagnosed. *FF7*. Therefore, the application of a travel time constraint of 30 minutes when identifying the projected population to be served by the elective angioplasty program is unfounded as patients may travel to existing elective PCI programs in the area within 24 to 48 hours.

Finally, the Applicants incorrectly state that several of the towns included in their proposed service area are closer to Backus than any other PCI-capable facility. Backus would not be the closest PCI-capable hospital for several of the towns it included in its proposed SA. For example, UMass would be the closest PCI facility for patients originating from Thompson, Putnam, Pomfret or Woodstock. *FF22*. Additionally, as the only acute care hospital in Northeast Connecticut, Day Kimball would likely be the hospital at which patients from that area (including Thompson, Putnam, Pomfret and Woodstock) showing signs of AMI would likely present. Day Kimball, as a hospital lacking PCI capabilities, has stated that it intends to transfer AMI patients to UMass. *FF23*. Due to Day Kimball's proximity to UMass and stated referral patterns, it is uncertain whether patients from multiple towns in the Applicant's proposed service area would seek treatment at Backus. Therefore, the Applicants have failed to adequately identify the population the proposed program may likely serve.

In order to assess whether there is a clear public need for the establishment of a new angioplasty program in a given region and a new program's anticipated impact on existing providers, it must be determined, in part, how many patients would likely receive treatment at the new program. Based on Backus' historic inpatient discharges, its service area, and projected population to be served, is: Canterbury, Colchester, Griswold, Lisbon, Ledyard, Montville, Norwich, Preston, Plainfield and Groton. *FF15*.

Based on declining utilization rates, the increasing use of non-surgical medications and alternate methods of treatment and diagnosis of cardiovascular events the Applicants have not demonstrated that there is a clear public need for a new angioplasty program in the service area.

The Applicants claim that towns in their service area experience elevated incidents of STEMI and NSTEMI compared to Connecticut overall and that this indicates an unmet need for PCI services exists in the proposed service area. While the proposed service area did have a 2010 incidence rate of 104.3 STEMIs per 100,000 people--higher than Connecticut's 83 -- its incidence rate of NSTEMI for the same period was lower than that of the state -- 237.2 compared to 242.3. *FF24*. This suggests that although there may be a need for primary PCI services to address STEMI patients in the area, the NSTEMI data provided by the Applicants does not support the need for an elective program. Additionally, according to Applicants-provided

inpatient elective PCI procedure volume, there is a declining trend in elective PCIs in the area -- consistent with the trend observed state-wide. *FF25.*

Furthermore, other indicators of the need for an elective PCI program in the area are also declining. The number and percentage of cardiac catheterization transfers from a non-PCI facility to a PCI-capable facility for elective angioplasties are two such indicators. The number of patient transfers for an elective PCI following a cardiac catheterization at Backus decreased from 90 in 2012 to 46 in 2015. The transfer rate similarly decreased, from 28.4% in 2012 to 19.4% in 2015. *FF26* This mirrors the state and national data indicating a declining need for elective PCIs.

According to the 2014 Guidelines, due to the increased use of non-surgical alternatives, the number of PCIs performed is likely to continue to decline. It states that drug-eluting stents, enhanced primary and secondary prevention efforts and a greater emphasis on medical therapy are increasingly replacing PCIs as the choice treatment in certain situations. *FF27.*

Additionally, as discussed above, the Applicants cite the DPH OEMS Guidelines as evidence of the need for a PCI program at Backus but misstate the standards and goals of the policy. The Applicants state that "[residents] to the north and east of Norwich do not have timely access to a Connecticut primary or elective PCI-equipped hospital within 30 minutes' drive time, as specified by DPH OEMS Guidelines." *Ex.A, p. 16.* However, the referred-to standard pertains to EMS transport of patients with pre-hospital-diagnosed STEMI and is intended to assess whether such patients should be transported to a PCI-capable hospital based on travel time, recommending STEMI patients be transferred to a PCI-capable hospital if one is less than 30 minutes away. *FF17.* The OEMS Guidelines make no indication as to the ideal location of PCI facilities and do not recommend that all towns be within a 30 minute drive time of a PCI facility.

The Applicants again cite DPH OEMS Guidelines regarding EMS transport, stating that STEMI patients should be identified in the field via an electrocardiogram (ECG) in effort to direct patients expeditiously to the appropriate level of care. The Applicants continue that there are only 15 emergency advanced life support vehicles with ECGs to cover 13 towns in the Backus region. The Applicants suggest that because there may be an insufficient number of ECG-equipped emergency transport vehicles, some patients may not be identified as STEMI prior to delivery at a hospital and therefore Backus requires PCI capabilities to treat these patients. *Ex. A, p. 34.* An insufficient number of ECG-equipped vehicles does not equate to the need for a PCI program at every hospital, but rather speaks to whether there is a need for additional appropriately-equipped emergency vehicles.

The Applicants-provided data shows that there may be elevated incidence of STEMIs in the Backus area, potentially warranting a primary PCI program. A shortage of ECG-capable emergency transport vehicles may also highlight the need for additional advanced life support vehicles in the region. However, the declining incidence of NSTEMIs in the region and declining number of cardiac catheterization patients transferred from Backus to an elective PCI-capable hospital do not demonstrate the need for an elective PCI program at Backus. As such, the

Applicants have not demonstrated a clear public need for the as-proposed PCI program at Backus.

The Application does not meet the ACCF/AHA/SCAI Guidelines for proposed PCI programs and, as such, is not consistent with the Statewide Health Care Facilities and Services Plan.

The Department of Public Health's *2012 Statewide Health Care Facilities and Services Plan* standards and guidelines for proposed primary and elective PCI programs draw from those set forth by ACCF/AHA/SCAI. The ACCF/AHA/SCAI Guidelines establish the appropriate minimum volume of PCIs that should be performed at both a facility and by the individual medical professionals administering the procedures. *FF13.*

A facility volume of fewer than 200 PCIs performed per year is, according to the 2014 update of the Guidelines, associated with worse patient outcomes. *FF29.* Therefore, it is recommended that a facility perform at least 200 PCIs per year, 36 of which should be primary PCIs. According to the Plan, "a facility with a volume of fewer than 200 procedures per year, unless located in a region that is underserved because of geography, should carefully consider whether it should continue to offer this service." Geographic isolation exists if the emergency transport time from a non-PCI facility to a PCI capable facility is greater than 30 minutes. *FF29.*

In 2015, patients originating from Backus' service area received approximately 369 PCIs at existing PCI-capable hospitals. *FF32.* Based on a presumed 100% retention rate of patients who went to Hartford and 36% of those who went to the other six hospitals not affiliated with Backus, the Applicants projected Backus would initially perform 165 PCIs—55 of which were primary. *FF32,33,35.* This projection falls significantly short of the 200 procedures recommended by the Guidelines.

L+M, which provides both primary and elective PCIs, is a 21-minute drive from Backus. *FF30.* It can be expected that the emergency transport time would be potentially shorter. As such, Backus does not qualify as geographically isolated and, according to the Guidelines, should not establish a PCI facility due to the likelihood it would fall below the minimum volume recommended for even a low-volume operator.

The Guidelines also state that "[m]ultiple low-volume and partial service-PCI centers within a geographic area diffuse PCI expertise, increase costs for the overall health system and have not been shown to improve access." *FF29.* Not only would Backus' PCI program be unlikely to meet the recommended minimum volume, it would likely have a negative impact on L+M patient volumes, creating precisely the multiple low-volume provider situation the Guidelines warn against. In 2015, L+M performed 216 angioplasty procedures. Sixty-three PCI patients originated from Backus' service area. *FF33.* Had those 63 patients gone to Backus, L+M would have performed only 153 PCI procedures, also falling below the recommended guidelines. *FF35.* L+M has stated that it has no backlog and can accept additional volume. *FF34.*

The Applicants have not satisfactorily demonstrated that the proposal will not result in an unnecessary duplication of services or how the proposal is needed based on utilization at existing PCI providers.

As discussed above, maintaining a certain level of utilization at existing providers is considered necessary to upholding the competency of a hospital and its physicians in performing PCIs. According to the Applicants, residents from Backus' service area who receive PCI treatment currently do so at Hartford, Yale-New Haven Hospital, L+M, Saint Francis Hospital, John Dempsey Hospital, The Hospital of Central Connecticut or UMass Memorial. *FF32.*

The proposal will impact existing providers and the existing providers are not currently being fully utilized by the Applicants. L+M would likely be the existing PCI provider most impacted by the Applicants' proposal. L+M performed 216 PCIs in 2015, 63 of which originated from Backus' service area. *FF32,33.* The Applicants and L+M presented multiple estimates as to the number of patients from Backus' service area who would seek service at Backus rather than the existing hospitals. The proposed retention rate estimates varied from 36% to 80%. *FF36.* Regardless of the precise retention rate applied, either L+M or Backus would not reach the minimum 200 procedures recommended by the Guidelines if the proposal is approved.

Additionally, L+M established its elective PCI program subsequent to entering into an Agreed Settlement with OHCA in 2013. *FF37.* The agreement was based on the expectation that L+M would be able to perform the Guidelines-established minimum number of PCIs of 200 per year. L+M does not anticipate that it will be able to meet the Guidelines minimum and will not be able to comply with this term of the agreement if Backus establishes a program. *FF37.*

The Applicants state that Backus is currently unable to meet the 120 minute door-to-balloon guideline regarding transferring AMI patients to a primary PCI-capable hospital. *FF19.* From 2011 through 2015, Backus' median door-to-balloon time was 134 minutes and travel time to a PCI-capable hospital accounted for the largest portion of Backus' transfer times. *FF19.* However, according to the Applicants, Backus has only transferred three patients to L+M, which is 21 minutes away. According to the Applicants, due to referral patterns, Backus transfers the majority of patients in need of primary PCI to Hartford, 40 minutes away. *FF20,32.* As such, the Applicants have not provided sufficient evidence demonstrating a need for a PCI program. The majority of patients that would be treated at Backus are currently being treated by other providers and, therefore, this proposal represents merely a shift in patient volume due to siphoning patients from existing providers.

The Applicants would likely be able to absorb the financial losses of the program.

The Applicants estimate Backus would need to perform 385 PCI procedures for the program to break even financially, and do not anticipate performing the necessary number of procedures through 2020, at which point they project the program would perform approximately 233 procedures *FF39.* The Applicants also estimate the proposal would necessitate nearly $5 million of capital expenditures in the form of an additional catheterization lab, new software and

equipment upgrades, as well as 3% of net patient revenues for ongoing capital needs. *FF40.* The program would operate at a loss of $355,363 in FY16, increasing to $705,757 in FY19. *FF38.*

The Applicants' projections, however, were conservative and assumed no increase in payer reimbursement but included increased costs and accounted for inflation. *FF38.* Additionally, the Applicants project income gains from overall operations at Backus from FY17 through FY19, sufficient to compensate for the program's increasing year-to-year losses. *FF42.* Although the program in itself would not be financially feasible due to increasing losses, the Applicants would be able to absorb those losses. As such, the proposal is financially feasible.

The Applicants have not satisfactorily demonstrated how the proposal would improve quality, accessibility and cost effectiveness of health care delivery, including to indigent and Medicaid patients.

The presence of a PCI program on-site at Backus would obviate the need for revascularization following a cardiac catheterization diagnosis, allowing the diagnostic and elective procedure to be completed together. This would reduce patient exposure to radiation and intravenous contrast used during the procedure. *FF12.* Currently, when Backus performs a cardiac catheterization and discovers a partial blockage, a patient must schedule an elective PCI elsewhere and then have the catheterization re-performed at that time. With the proposal, Backus would be able to perform the elective PCI at the time of catheterization.

As discussed, there are indisputable benefits to minimizing the time between when a patient presents at the emergency department and when the colluded artery is reopened. *FF18.* AMI patients currently presenting at Backus must be transported to a PCI-capable hospital, delaying treatment. Although a primary PCI program at Backus would decrease transport time, the Guidelines state that the door-to-balloon time should be within 120 minutes. *FF11.* Currently PCI-capable hospitals exist in Backus' area to which Backus could transport patients and the 120 minute window could be met. *FF32.* Although the Applicants have demonstrated how the proposal would improve quality of care, it is unclear the extent of the improvement.

Despite these potential benefits of the proposal, the Guidelines state that the minimum number of PCIs a facility should perform is set to maintain the competency of the hospital and its physicians. *FF29.* Should Backus' proposed program not meet that minimum, it is possible competency may not be maintained. Furthermore, the proposed program risks syphoning enough patients from existing hospitals to also depress the number of procedures performed at other area hospitals. *FF32,33,35.* It is possible quality may be compromised not only at Backus, but surrounding PCI-providers, as well.

The proposal would, as the establishment of a new service, likely increase access to care for Medicaid and indigent patients as Applicants' projected payer mix is comprised of 11% Medicaid and 37% uninsured. *FF43.*

Based on the aforementioned findings of fact, the Applicants have failed to meet their burden of proof in satisfying the statutory requirements of Conn. Gen. Stat. §§ 19a-639. The Applicants have neither satisfactorily identified the patient population to be served with an elective and primary PCI program nor have they demonstrated, in light of decreasing utilization and the existence of other providers in the area, that there is a clear public need for the proposed service. Furthermore, the proposal is likely to have a detrimental effect on existing providers in the area and may negatively impact the quality of care afforded patients. Finally, the Applicants have not sufficiently shown that the proposal is consistent with the PCI standards in the ACCF/AHA/SCAI Guideline and Statewide Health Care Facilities and Services Plan. However, as the proposal is neither a termination nor consolidation of health care providers, the proposal would not negatively impact the diversity of providers or choice for patients in the area.

Order

Based upon the foregoing Findings and Discussion, I respectfully recommend that the Certificate of Need application of The William W. Backus and Hartford Hospital to establish a primary and elective PCI program without on-site surgical backup be DENIED.

Hi Olga. Under the statute, if Backus decides to challenge the proposed decision, it must do so within 21 days from the mailing of the decision. Do you know whether an extension of time is possible? Thanks for your help.

Hi Janette,

Pursuant to 19a-9-29(h) of the Regulations of Connecticut State Agencies:

Unless otherwise ordered by the presiding officer, any party who wishes to challenge a proposed final decision under section 4-179 of the Connecticut General Statutes shall file exceptions or a brief or request oral argument, within twenty-one(21) days of the mailing of the decision. Any party who wishes to present a brief or requests oral argument in support of a proposed final decision shall do so within thirty-five (35) days of the mailing of the decision.

Thanks.

Leslie and Olga,

We received the proposed final decision for DN 15-32031-CON and are in the process of reviewing internally. Can you please provide me specifics on the procedure for proposed decisions, and timeframe for response? It will be helpful to our internal dialogue.

Thanks,
Janette

Final Decision

Applicants:

The William W. Backus Hospital
326 Washington Street,
Norwich, CT 06360

Hartford Hospital
80 Seymour Street,
Hartford, CT 06102

Docket Number: **15-32031-CON**

Project Title: **Establishment of a Primary and Elective Percutaneous Coronary Intervention Program at Backus Hospital without On-Site Surgical Backup**

Project Description: The William W. Backus Hospital ("Backus") and Hartford Hospital ("Hartford") (Backus and Hartford are herein collectively referred to as the "Applicants") seek authorization to establish and operate a primary and elective percutaneous coronary intervention ("PCI" or angioplasty) program at Backus without on-site cardiac surgical backup, at an associated capital cost of $4,982,053.

Procedural History: The Applicants published notice of their intent to file a Certificate of Need ("CON") application in *The Bulletin* (Norwich) on September 7, 8 and 9, 2015. On September 30, 2015, the Office of Health Care Access ("OHCA") received the CON application from the Applicants for the above-referenced project. On January 29, 2016, OHCA deemed the application complete.

On March 9, 2016, the Applicants were notified of the date, time, and place of the public hearing. On February 11, 2016, a notice to the public announcing the hearing was published in *The Bulletin* (Norwich). Thereafter, pursuant to Connecticut General Statutes ("Conn. Gen.

Keeping Connecticut Healthy
DPH
Connecticut Department of Public Health

Phone: (860) 418-7001 • Fax: (860) 418-7053
410 Capitol Avenue, MS#13HCA
Hartford, Connecticut 06134-0308
www.ct.gov/dph
Affirmative Action/Equal Opportunity Employer

Stat.") § 19a-639a(f)(2), the public hearing regarding the CON application was held on March 23, 2016 and continued on June 14, 2016.

Commissioner Pino designated Attorney Kevin T. Hansted as the hearing officer in this matter. The hearing was conducted in accordance with the provisions of the Uniform-Administrative Procedure Act (Chapter 54 of the General Statutes) and Conn. Gen. Stat. § 19a-639a(f)(2).

On March 16, 2016, Lawrence + Memorial Hospital ("L+M") filed a petition requesting intervenor status. L+M was granted intervenor status with full rights in this matter on March 17, 2016.

On March 22, 2016 the Applicants filed a Motion in Limine to preclude use of data regarding out-of-state PCI providers. On March 23, 2016 L+M filed an objection to the Applicants' Motion in Limine. On March 31, 2016, Hearing Officer Hansted denied the Applicants' motion and sustained L+M's objection. The public hearing record was closed on June 22, 2016.

On August 25, 2016 OHCA issued a Proposed Final Decision denying the Applicants' CON application. Pursuant to section 19a-9-29(h) of the Regulations of Connecticut State Agencies the Applicants had twenty-one days from the date the Proposed Final Decision was issued to file exceptions or a brief or request oral argument. On September 14, 2016 the Applicants notified OHCA that it would not challenge the Proposed Final Decision. Deputy Commissioner Addo reviewed the entire record in this matter.

Findings of Fact

1. Backus is a 233-bed/bassinet acute care hospital, located at 326 Washington Street in Norwich, CT, and is affiliated with Hartford. Exhibit A, p. 13.

2. Hartford is an 867-bed major teaching hospital affiliated with the University of Connecticut School of Medicine and a regional referral center serving New England. Hartford's Henry Low Heart Center is a full service cardiac provider that offers the following services:
   a. Cardiac catheterization, angioplasty, electrophysiology and rehabilitation programs;
   b. A congestive heart disease center;
   c. Echocardiography;
   d. Extracorporeal membrane oxygenation;
   e. A heart failure infusion program;
   f. Heart surgery and transplants;
   g. Nuclear cardiology; and
   h. A transcatheter aortic valve replacement program.

   Exhibit A, p. 13, 24.

3. Backus currently offers the following inpatient and outpatient cardiac services:
   a. Diagnostic cardiac catheterizations;
   b. Pacemaker insertions, evaluations and follow-ups;
   c. Implantable cardiac defibrillator insertions, evaluations and follow-ups;
   d. Stress testing;
   e. Nuclear cardiac imaging;
   f. Cardiac imaging services;
   g. Echocardiology;
   h. 24- and 48-hour monitoring;
   i. ECG testing;
   j. Electrical cardioversions;
   k. Intra-aortic balloon pumping;
   l. Vascular surgical services offered by interventional radiology staff such as peripheral angioplasty and stenting;
   m. Heart failure program that offers monitoring and a program coordinator for patients beyond the inpatient setting; and
   n. Three phase cardiac rehabilitation program consisting of inpatient, outpatient and outpatient maintenance.

   Exhibit A, p. 20-21.

4. The Applicants are proposing the expansion of cardiac services at Backus by establishing and operating a primary and an elective PCI program without on-site cardiac surgical back-up. Backus' 12-bed critical care unit would be the primary unit for all post-PCI patients. Exhibit A, pp. 13, 21.

5. Angioplasty is an interventional procedure whereby a catheter, usually inserted into an artery in the groin, is threaded through the circulatory system to a diagnosed blockage in the heart. An expandable balloon is passed through the artery and inflated, flattening blockage-causing plaque and allowing for improved blood-flow. Exhibit A, p. 14.

6. Primary PCI is used to treat emergency situations, such as ST-Segment Elevation Myocardial Infarctions ("STEMI"), which occur when an acute coronary thrombosis blocks a coronary artery. Elective PCI is often a scheduled procedure following extensive cardiac testing or a post-cardiac event to relieve chest pain and related symptoms. Exhibit A, p. 14.

7. STEMI patients requiring primary PCI, need the most urgent care and are treated on an emergency basis. Elective PCI procedures for patients with non-ST-segment elevation myocardial infarction ("NSTEMI") are often scheduled, but ideally take place within 24-48 hours of diagnosis, effectively reducing the risk of future cardiac events. Ex. A, pp. 14-15; Ex. BB, Transcript, Dr. Francis J. Kiernan, Director of Cardiac Laboratory, Hartford Hospital, pp. 103-104.

8. Hartford provides comprehensive cardiac services and performs more than 1,000 angioplasties annually. Hartford and Backus have entered into an agreement for the emergency transfer of patients to Hartford for off-site surgical backup for urgent cases at all hours and for elective cases at mutually agreed upon hours, as well as the necessary training and oversight of the proposed PCI program at Backus. Ex. A, pp. 46, 99, 892-93.

9. The Applicants submitted the following agreements, policies and protocols:
   - Primary PCI Patient Selection Guidelines
   - 2011 ACCF/AHA/SCAI Guidelines for Percutaneous Coronary Intervention and How Backus Will Meet the Standards
   - Elective PCI Patient Selection Guide
   - Transfer Protocol and Agreement between the Applicants
   - Cardiac Surgery Transfer Agreement Between Hartford and Backus
   - Clinical Guidelines for Transfer of Catheterization Lab Patients to Acute Care Facility

   Ex. A. pp. 88, 84-87, 89, 892-897

10. The Applicants claim benefits of the proposal include:
    a. Improved access for an area of the state that:
       (i) is "geographically isolated" from the nearest PCI provider;
       (ii) has an older population with a relatively higher risk than the state for coronary artery disease;
       (iii) has current rates of emergency/primary and elective PCI interventions for residents that are significantly below state and national levels leading to relatively higher rates of morbidity and mortality;
    b. Minimized out-of-pocket costs associated with second hospital admission and duplicative procedures; and

c. Improved future care coordination and management for patients with heart conditions.

Exhibit A, p. 13.

11. The ACC/AHA STEMI Guidelines provide that "door-to-balloon" time, measured from the time a patient presents at the emergency department of a PCI-capable hospital to the time a balloon is inflated to open the occluded artery, should not exceed 90 minutes. The recommended door-to-balloon time for patients presenting at a non-PCI capable hospital from which the patient must be transferred to another hospital is 120 minutes. Exhibit A, pp. 47, 500.

12. The presence of a PCI program on-site at Backus would obviate the need for revascularization following a cardiac catheterization diagnosis, enabling the diagnostic and elective procedure to be completed together. This would reduce patient exposure to radiation and intravenous contrast used during the procedure. Ex. A, p. 62.

13. The Statewide Health Care Facilities and Services Plan states that hospitals seeking to establish an elective PCI program without on-site cardiac surgery must:
    a. Meet the conditions required in the American College of Cardiology Foundation/American Health Association/Society for Cardiovascular Angiography and Interventions ("ACCF/AHA/SCAI) Practice Guideline (the " Guideline") for percutaneous coronary intervention without on-site surgical backup; and
    b. Demonstrate a clear public need for the program. Specifically, the Guideline indicates that it is only appropriate to consider the initiation of the PCI program without on-site cardiac surgical backup if this program will clearly fill a void in the healthcare needs of the community as competition with another PCI program in the same geographic area may not be in the best interests of the community.

    Exhibit A, pp. 38-39, 47.

14. The Applicants' proposed service area ("proposed service area") included a) towns within a 30 minute drive-time to Backus, and b) towns outside of the 30-minute radius but for which Backus would be the closest PCI-capable facility in Connecticut. This classification excluded out-of-state PCI providers.

TABLE 1
APPLICANTS' PROPOSED SERVICE AREA

Towns within a 30-minute drive time of Backus Hospital			Towns for which Backus would be the closest in-state PCI provider
Bozrah	Killingly	Preston	East Haddam
Brooklyn	Griswold-Lisbon	Scotland	Hampton
Canterbury	Hebron	Sprague	Pomfret
Chaplin	Killingly	Sterling	Putnam
Colchester	Mansfield Center	Voluntown	Thompson
Columbia	Norwich	Windham	Woodstock
Franklin	Plainfield		

Exhibit A, p. 35.

15. Based on fiscal year ("FY") 2015 inpatient discharges for Backus, the towns below comprise Backus' service area ("SA").[1] The Applicants' proposed service area included 20 towns beyond Backus Hospital's SA (Bozrah, Brooklyn, Columbia, Franklin, Hebron, Killingly, Lebanon, Mansfield Center, Scotland, Sprague, Sterling, Voluntown, Windham, East Haddam, Hampton, Pomfret, Putnam, Thompson and Woodstock). Additionally, the proposed service area omitted three towns that are in the SA (Groton, Ledyard and Montville).

TABLE 2
BACKUS HOSPITAL DISCHARGES, FY 2015

Patient Town	Discharges	% of Total Discharges	Cumulative %
Norwich	3,729	35%	35%
Griswold- Lisbon	1,169	11%	46%
Montville	910	8%	54%
Plainfield	843	8%	62%
Preston	346	3%	65%
Colchester	322	3%	68%
Canterbury	273	3%	71%
Ledyard	269	3%	73%
Groton	251	2%	76%
Remaining Towns/States	2,611	24%	100%
Total	**10,723**	**100%**	**100%**

Source: CT DPH, Office of Health Care Access Acute Care Discharge Database

16. The Applicants stated that they selected drive time as the basis for the proposed service area because of the "urgency of time, in order to access [PCI] services." Additionally, they stated that they selected 30 minutes as the perimeter of the drive time based on the Department of Public Health Office of Emergency Management Services, *Connecticut EMS STEMI Guidelines* ("DPH OEMS Guidelines"). Ex. T, Transcript, Mr. M. Shane Foreman, CEO, 3d Health, p. 34; Ex. K, Pre-filed Testimony, Foreman, 1543.

17. The stated goal of the DPH OEMS Guidelines is to "ensure that authorized EMS personnel obtain a 12-lead electrocardiogram in the field on all patients with suspected MI, thereby increasing the likelihood they will be transported for treatment with PCI intervention within 90 minutes of first medical contact." It directs emergency medical vehicles transporting a patient already identified as STEMI to bring the patient to a PCI-capable facility if it is less than 30 minutes away. It also states that emergency vehicles

1. SA is defined as towns that make up the top 75% of a hospital's discharges. CT DPH, *Statewide Health Care Facilities Plan* 76 (2014 Supplement.).

should be 12-lead echocardiogram-equipped to facilitate early identification of STEMI patients. Ex. A, p. 969-970.

18. There are proven beneficial outcomes associated with reducing the time between a patient's presentation at the emergency department to inflation of the balloon to open the occluded artery ("door-to-balloon time") during a primary PCI procedure. Ex. T, Transcript, Dr. Paul Thompson, Chief of Cardiology, Hartford Hospital, p. 29.

19. From 2011 through 2015, Backus' median door to balloon time for primary PCI was 134 minutes. Transport time to a PCI-capable hospital accounted for the largest portion of the door-to-balloon time. Ex. A, p. 473, 476.

20. Backus has historically transferred patients to Hartford and Yale New Haven Hospital for primary PCI, transferring only three patients in the past to the closest PCI-provider, L+M. The Applicants stated this was due primarily to referral patterns. Ex. T, Transcript, Dr. Kyle McClaine, EMS Director, Backus Hospital, p. 151-152; Ex. BB, Transcript, Dr. John Foley, Director of Cardiovascular Service Line, Hartford Medical Group, p. 138.

21. UMass Memorial Medical Center ("UMass") submitted a letter stating that it has an ongoing relationship with Day Kimball Hospital ("Day Kimball") and established protocols are in place for receiving NSTEMI transfer patients from Day Kimball. It also states that UMass' PCI program currently has capacity to continue treating transfers and referrals from Day Kimball. Ex. V; pp. 1-2.

22. UMass is the closest existing PCI provider, based on travel time, for four out of the six towns in northeast Connecticut the Applicants included in their proposed service area.

TABLE 3
TRAVEL TIMES FROM NORTHEAST TOWNS INCLUDED IN THE PROPOSED SERVICE AREA TO CLOSEST HOSPITAL*

Select Towns	Drive time to Backus Hospital	Drive time to UMass Hospital
East Haddam	27 minutes	78 minutes
Hampton	27 minutes	46 minutes
Pomfret	36 minutes	33 minutes
Putnam	33 minutes	26 minutes
Thompson	35 minutes	23 minutes
Woodstock	39 minutes	33 minutes

* Based on Google Maps travel time without traffic from center of town

23. Day Kimball, located at 320 Pomfret Street, Putnam, stated in its 2015 Community Health Needs Assessment and Implementation Plan that it "continues to work closely with UMass for STEMI patient transfers via Life Star helicopter within 90 minutes of

admission to the emergency department and meets regularly to review STEMI data." Ex. W, p. 4.

24. In 2010, towns in the proposed service area experienced an incidence rate of 104.3 STEMIs per 100,000; Connecticut overall experienced a rate of 83. Towns in the proposed service area experienced an incidence rate of 237.2 for NSTEMIs; Connecticut overall had a higher incidence of NSTEMIs at 242.3. Ex. A, p. 463.

25. Over a seven year period, patients in the proposed service area underwent fewer inpatient elective PCIs; declining from 316 in FY09 to 171 in FY15. This is consistent with state-wide trends. Ex. A, p. 466, 1499-1500.

26. The number of patients transferred for an elective PCI following a cardiac catheterization at Backus was 90 in 2012, 90 in 2013, 55 in 2014, 46 in 2015 and 33 in 2016 (annualized). The percentage of cardiac catheterization patients transferred from Backus to a PCI-capable facility also decreased, from 28.4% in 2012 to 19.4% in 2015. Ex. CC, p. 1570.

27. According to the SCAI/ACC/AHA's *Expert Consensus Document: 2014 Update on Percutaneous Coronary Intervention Without On-Site Surgical Backup* ("2014 Guidelines"), multiple factors have contributed to the decline in PCI procedures, including "a reduction in restenosis by drug-eluting stents, a greater emphasis on medical therapy for the treatment of stable coronary artery disease, enhanced primary and secondary prevention efforts, and a reduction in incidence of STEMI…" Ex. A, p. 113.

28. According to the Applicants, there are an insufficient number of emergency advanced life support vehicles in the Backus region, with 15 covering 13 towns in the Backus region. Ex. A., p. 34.

29. The 2014 Guidelines state that "an institutional volume threshold of <200 PCIs/year was associated with worse outcomes" and therefore "continued operation of laboratories performing <200 procedures annually that are not serving isolated or underserved populations be questioned." It continues to say that "multiple low-volume and partial service PCI centers within a geographic area diffuse PCI expertise, increase costs for the overall health system and have not been shown to improve access." It defines "geographic isolation" as a hospital that is more than 30 minutes away from a PCI-capable facility by emergency transport. Ex. A, pp. 119-121.

30. L+M, a PCI-capable facility, is located 17 miles, or 21 minutes from Backus. Ex. T, Transcript, Dr. Brian Cambi, Director of Cardiology, L+M Hospital, p. 51.

31. Based on historic PCI utilization of residents originating from Backus' SA at other area hospitals[1], the Applicants project Backus would perform 163 PCIs in FY16, increasing slightly to 169 in FY18.[2]

TABLE 4
PROJECTED PCI UTILIZATION AT BACKUS HOSPITAL

Category	FY16	FY 17	FY18
Primary PCI	55	54	54
Elective PCI	108	111	115
Total	**163**	**165**	**169**

[1] Includes Backus SA patients receiving PCIs at: Hartford Hospital, Yale New Haven, Saint Francis, John Dempsey, The Hospital of Central Connecticut, UMass Memorial and Lawrence + Memorial Hospital.

[2] Assumes a retention rate of 100% of patients receiving PCIs at Hartford Hospital and 36% from other hospitals based on Backus' ED market share.

Ex. K, p. 1497; Ex. E, pp. 1458, 1466.

32. There are no PCI providers in the Applicants' proposed service area. However, the following hospitals have administered PCIs to 369 patients originating from Backus' SA in 2015.

TABLE 5
2015 PCI PROVIDERS TREATING PATIENTS ORIGINATING FROM BACKUS' SA

PCI Providers	Distance from Backus[1]	No. of PCIs Originating from Backus SA	No. of PCIs	No. of PCIs minus No. from Backus SA	% of PCIs from Backus SA
Hartford Hospital	40 minutes	50	1,099	1,049	4.5%
Yale New Haven Hospital	53 minutes	145	1,575	1,430	9.2%
Saint Francis Hospital	39 minutes	24	784	760	3%
John Dempsey Hospital	58 minutes	30	399	369	7.5%
The Hospital of Central CT	48 minutes	15	85	70	17.6%
UMass Memorial	60 minutes	54	~1,100	1,046	~5%
Lawrence + Memorial Hospital	21 minutes	63*	216	165	23.6%

[1] Distance based on Google Maps normal travel time

* Based upon 2015 inpatient discharge data. All other figures reflect 2014 inpatient discharge data.

Ex. A, p. 46; Ex. E, p. 1458.

33. In 2015, L+M performed 216 PCIs, 63 of those PCI patients originated from Backus' SA.

TABLE 6
2015 PCI PATIENTS FROM SA TREATED AT L+M

	2015 Town Totals		2015 L+M PCIs	
SA Towns	No. Primary PCIs	No. Inpatient Elective PCIs*	No. Primary PCIs	No. All Elective PCIs

		No. Remaining at L+M	**78**	**75**

* Outpatient elective PCI data unavailable

Ex. A, pp. 1499-1500; Ex. M, p. 12.; Compliance Reporting for Docket No. 12-31769

34. L+M stated that it has additional capacity to handle transfers from other non-PCI centers. Ex. BB, Transcript, Dr. Cambi, p. 158.

35. The 153 primary and elective PCI patients that would remain at L+M if Backus were to have a PCI program and capture all patients from its SA towns falls below the 200 level recommended by the 2014 Guidelines. Exhibit A, pp. 1499-1500.

36. The Applicants and L+M submitted conflicting claims as to the average retention rate of patients from a PCI provider's service area. The Applicants initially based their projection assumptions on an 80% retention rate of PCI patients from their proposed service area based on observed emergency department market share from the area. L+M asserted that those seeking scheduled elective PCIs would not mimic emergency room patterns and that L+M experienced an overall PCI retention rate of 54%. The Applicants then based final projection rates on a 100% retention rate for patients who had previously received PCIs at Hartford and 36% for those visiting all other hospitals. Ex. A, p. 489; Ex. BB, Testimony, Ms. Edwards, p. 139; Ex. BB, Testimony, Mr. Bitmal Patel, President of the East Region and Senior Vice President, Hartford HealthCare, p. 139; Ex. K, p. 197.

37. L+M established its elective PCI program in 2013. Per the Agreed Settlement with OHCA approving establishment of its program, L+M is expected to perform a quantity of procedures above those recommended by the 2014 Guidelines. L+M has stated it is likely to fall well below the minimum threshold should Backus initiate its own PCI program. Ex. M, p. 26; OHCA Docket Number 12-31768-CON.

38. Backus projects a financial loss from the operation of a PCI program with increasing incremental losses from operations, from FY2017 through FY2019.

TABLE 7
PROJECTED INCREMENTAL REVENUES AND EXPENSES

	FY 2017	FY 2018	FY 2019
Revenue from Operations*	$4,750,000	$4,911,295	$4,970,474
Total Operating Expenses**	$5,208,730	$5,470,996	$5,676,231
Gain/Loss from Operations	($457,817)	($559,701)	($705,757)

* Net revenue per case remains flat and assumes no increase in payer reimbursement
** 2.68% inflation rate applied over five resulting in increasing expenses; 2.6 new FTE cardiology staff, on-call payment and call back pay to staff, 24/7 on call physician expenses at $125/hr. Exhibit A, p. 1409; Ex. BB, Transcript, Ms. Janette Edwards, Backus Hospital, p. 128.

39. Backus would need to perform 385 PCI procedures in year five of the program to break even financially. The Applicants project they would perform 233 procedures in the year 2020. Ex. A, pp. 68, 70.

40. Estimated capital expenditures associated with the proposal are almost $5 million. Capital costs would support an additional catheterization lab, new software and equipment upgrades. An additional 3% of net patient revenues would be committed to ongoing capital needs. The Applicants' proposed capital expenditures are as follows:

TABLE 8
TOTAL PROPOSAL CAPITAL EXPENDITURES

Purchase/Lease	**Cost**
Equipment (Medical, Non-medical Imaging)	$344,000
Construction/Renovation	$4,500,000
Other (specify) (*estimated 3% of operating revenue for additional capital needs*)	$138,053
Total Capital Expenditure (TCE)	**$4,982,053**
Total Capital Cost (TCO)	**$0**
Total Project Cost (TCE+TCO)	**$4,982,053**

Exhibit A, pp. 67, 77.

41. The Applicants would fund the proposal through Backus' income from operations. Exhibit A, p. 65.

42. The Applicants project overall gains from Backus' operations from FY17 through FY19.

TABLE 9
BACKUS HOSPITAL PROJECTED REVENUES AND EXPENSES WITH CON

	FY 2017	FY 2018	FY 2019
Revenue from Operations	$308,297,624	$317,799,924	$329,208,612
Total Operating Expenses	$270,537,970	$276,777,162	$285,116,496
Gain/Loss from Operations	$37,759,653	$41,1022,761	$44,062,116

Exhibit A, p. 1409.

43. The projected patient population mix for the proposed PCI program is as follows:

TABLE 10
BACKUS HOSPITAL'S PROJECTED PAYER MIX

Payer	Projected**					
	FY 2016		FY 2017		FY 2018	
	Volume	%	Volume	%	Volume	%
Medicare*	109	50%	110	50%	113	50%
Medicaid*	25	11%	25	11%	26	11%
CHAMPUS & TriCare	-	0%	-	0%	-	0%
Other Government	2	1%	2	1%	2	1%

Total Payer Mix	**216**	**100%**	**218**	**100%**	**225**	**100%**

*Includes managed care activity
**Payor-weighted reimbursement by DRG based on the payor mix of all PCI patients originating from the proposed service area.
Ex. A, p. 1469

44. OHCA is currently in the process of establishing its policies and standards as regulations. Therefore, OHCA has not made any findings as to this proposal's relationship to any regulations yet to be adopted by OHCA. (Conn. Gen. Stat. § 19a-639(a)(1))

45. The CON application is inconsistent with the Statewide Health Care Facilities and Services Plan. (Conn. Gen. Stat. § 19a-639(a)(2))

46. The Applicants have not sufficiently demonstrated that there is a clear public need for the proposal. (Conn. Gen. Stat. § 19a-639(a)(3))

47. The Applicants have satisfactorily demonstrated that the proposal is financially feasible. (Conn. Gen. Stat. § 19a-639(a)(4))

48. The Applicants have not satisfactorily demonstrated that access to services, cost effectiveness and the quality of health care delivery would be maintained. (Conn. Gen. Stat. § 19a-639(a)(5))

49. The Applicants have satisfactorily shown that there will be no change in access to primary and elective PCI services to the relevant populations and payer mix, including Medicaid patients and indigent persons. (Conn. Gen. Stat. § 19a-639(a)(6))

50. The Applicants have not satisfactorily identified the population to be served or that this population has a need. (Conn. Gen. Stat. § 19a-639(a)(7))

51. The Applicants' historical utilization in the area does not support this proposal. (Conn. Gen. Stat. § 19a-639(a)(8))

52. The Applicants have not satisfactorily demonstrated that the proposal will not result in an unnecessary duplication of existing services in the area. (Conn. Gen. Stat. § 19a-639(a)(9))

53. The Applicants have satisfactorily demonstrated that the proposal would not result in a reduction or change in access to services for Medicaid recipients or indigent persons. (Conn. Gen. Stat. § 19a-639(a)(10))

54. The Applicants have satisfactorily demonstrated that the proposal would not negatively impact the diversity of PCI providers in the area. (Conn. Gen. Stat. § 19a-639(a)(11))

55. The Applicants have satisfactorily demonstrated that the proposal will not result in any consolidation that would affect health care costs or accessibility to care. (Conn. Gen. Stat. § 19a-639(a)(12))

Discussion

CON applications are decided on a case by case basis and do not lend themselves to general applicability due to the uniqueness of the facts in each case. In rendering its decision, OHCA considers the factors set forth in Conn. Gen. Stat. § 19a-639(a). The Applicant bears the burden of proof in this matter by a preponderance of the evidence. *Jones v. Connecticut Medical Examining Board, 309 Conn. 727 (2013).*

Backus is a 233-bed/bassinet acute care hospital, located at 326 Washington Street in Norwich, CT, and is affiliated with Hartford. *FF1.* Hartford is an 867-bed major teaching hospital affiliated with the University of Connecticut School of Medicine and a regional referral center serving New England. *FF2.* Backus currently offers inpatient and outpatient cardiac services including diagnostic cardiac catheterizations, cardiac imaging services, echocardiology, intra-aortic balloon pumping and vascular surgical services offered, such as peripheral angioplasty and stenting, by interventional radiology staff. *FF3.*

The Applicants are proposing to expand cardiac services at Backus to include a primary and an elective PCI program. *FF4.* Backus' 12-bed critical care unit would be the primary unit for all post-PCI patients. *FF4.* Hartford would provide off-site surgical back-up. *F8.* Hartford provides comprehensive cardiac services and performs more than 1,000 angioplasties annually and, in addition to tertiary back-up, would provide the necessary training and oversight of Backus' newly established PCI program. *FF8.*

<u>The Applicants have not satisfactorily identified the population to be served by the proposal</u>

Rather than basing the service area on Backus' inpatient discharges, the Applicants based the projected population to be served on a combination of a) towns within a 30-minute radius from Backus and b) towns for which Backus would be the closest PCI-provider by travel time. *FF14.* According to the Applicants, it selected drive time because of the "urgency of time, in order to access [PCI] service." The Applicants stated they selected 30 minutes as the perimeter of the drive time based on the DPH OEMS Guidelines. *FF16.*

The Applicants' proposed service area is inappropriate for three reasons. First, the Applicants failed to provide an adequate rationale for its selection of 30 minutes as the perimeter for the towns to be served. The stated goal of the DPH OEMS Guidelines is to "ensure that authorized EMS personnel obtain a 12-lead electrocardiogram in the field on all patients with suspected MI." It is intended to provide guidance to emergency transport vehicles as to what hospital patients who have a pre-hospital diagnosed STEMI should be directed. *FF17.* Although it is well established that the time to reperfusion correlates to the extent of heart muscle damage in a patient experiencing acute myocardial infarction ("AMI"), the Applicants provided no recognized standard that establishes that every town should be within 30 minutes of a PCI-

capable facility. The Applicants' basis for a 30 minute drive time standard misinterprets the standards and the purpose of the DPH OEMS Guidelines.

Second, for NSTEMI patients requiring an elective -- as opposed to primary -- angioplasty, timing is less critical. According to the Applicants, patients presenting with a one or more significant arterial blockages that are non-life threatening, or NSTEMI, should receive an elective angioplasty within 24 to 48 hours of being diagnosed. *FF7*. Therefore, the application of a travel time constraint of 30 minutes when identifying the projected population to be served by the elective angioplasty program is unfounded as patients may travel to existing elective PCI programs in the area within 24 to 48 hours.

Finally, the Applicants incorrectly state that several of the towns included in their proposed service area are closer to Backus than any other PCI-capable facility. Backus would not be the closest PCI-capable hospital for several of the towns it included in its proposed SA. For example, UMass would be the closest PCI facility for patients originating from Thompson, Putnam, Pomfret or Woodstock. *FF22*. Additionally, as the only acute care hospital in Northeast Connecticut, Day Kimball would likely be the hospital at which patients from that area (including Thompson, Putnam, Pomfret and Woodstock) showing signs of AMI would likely present. Day Kimball, as a hospital lacking PCI capabilities, has stated that it intends to transfer AMI patients to UMass. *FF23*. Due to Day Kimball's proximity to UMass and stated referral patterns, it is uncertain whether patients from multiple towns in the Applicant's proposed service area would seek treatment at Backus. Therefore, the Applicants have failed to adequately identify the population the proposed program may likely serve.

In order to assess whether there is a clear public need for the establishment of a new angioplasty program in a given region and a new program's anticipated impact on existing providers, it must be determined, in part, how many patients would likely receive treatment at the new program. Based on Backus' historic inpatient discharges, its service area, and projected population to be served, is: Canterbury, Colchester, Griswold, Lisbon, Ledyard, Montville, Norwich, Preston, Plainfield and Groton. *FF15*.

Based on declining utilization rates, the increasing use of non-surgical medications and alternate methods of treatment and diagnosis of cardiovascular events the Applicants have not demonstrated that there is a clear public need for a new angioplasty program in the service area.

The Applicants claim that towns in their service area experience elevated incidents of STEMI and NSTEMI compared to Connecticut overall and that this indicates an unmet need for PCI services exists in the proposed service area. While the proposed service area did have a 2010 incidence rate of 104.3 STEMIs per 100,000 people--higher than Connecticut's 83 -- its incidence rate of NSTEMI for the same period was lower than that of the state -- 237.2 compared to 242.3. *FF24*. This suggests that although there may be a need for primary PCI services to address STEMI patients in the area, the NSTEMI data provided by the Applicants does not support the need for an elective program. Additionally, according to Applicants-provided

inpatient elective PCI procedure volume, there is a declining trend in elective PCIs in the area -- consistent with the trend observed state-wide. *FF25.*

Furthermore, other indicators of the need for an elective PCI program in the area are also declining. The number and percentage of cardiac catheterization transfers from a non-PCI facility to a PCI-capable facility for elective angioplasties are two such indicators. The number of patient transfers for an elective PCI following a cardiac catheterization at Backus decreased from 90 in 2012 to 46 in 2015. The transfer rate similarly decreased, from 28.4% in 2012 to 19.4% in 2015. *FF26* This mirrors the state and national data indicating a declining need for elective PCIs.

According to the 2014 Guidelines, due to the increased use of non-surgical alternatives, the number of PCIs performed is likely to continue to decline. It states that drug-eluting stents, enhanced primary and secondary prevention efforts and a greater emphasis on medical therapy are increasingly replacing PCIs as the choice treatment in certain situations. *FF27.*

Additionally, as discussed above, the Applicants cite the DPH OEMS Guidelines as evidence of the need for a PCI program at Backus but misstate the standards and goals of the policy. The Applicants state that "[residents] to the north and east of Norwich do not have timely access to a Connecticut primary or elective PCI-equipped hospital within 30 minutes' drive time, as specified by DPH OEMS Guidelines." *Ex.A, p. 16.* However, the referred-to standard pertains to EMS transport of patients with pre-hospital-diagnosed STEMI and is intended to assess whether such patients should be transported to a PCI-capable hospital based on travel time, recommending STEMI patients be transferred to a PCI-capable hospital if one is less than 30 minutes away. *FF17.* The OEMS Guidelines make no indication as to the ideal location of PCI facilities and do not recommend that all towns be within a 30 minute drive time of a PCI facility.

The Applicants again cite DPH OEMS Guidelines regarding EMS transport, stating that STEMI patients should be identified in the field via an electrocardiogram (ECG) in effort to direct patients expeditiously to the appropriate level of care. The Applicants continue that there are only 15 emergency advanced life support vehicles with ECGs to cover 13 towns in the Backus region. The Applicants suggest that because there may be an insufficient number of ECG-equipped emergency transport vehicles, some patients may not be identified as STEMI prior to delivery at a hospital and therefore Backus requires PCI capabilities to treat these patients. *Ex. A, p. 34.* An insufficient number of ECG-equipped vehicles does not equate to the need for a PCI program at every hospital, but rather speaks to whether there is a need for additional appropriately-equipped emergency vehicles.

The Applicants-provided data shows that there may be elevated incidence of STEMIs in the Backus area, potentially warranting a primary PCI program. A shortage of ECG-capable emergency transport vehicles may also highlight the need for additional advanced life support vehicles in the region. However, the declining incidence of NSTEMIs in the region and declining number of cardiac catheterization patients transferred from Backus to an elective PCI-capable hospital do not demonstrate the need for an elective PCI program at Backus. As such, the

Applicants have not demonstrated a clear public need for the as-proposed PCI program at Backus.

The Application does not meet the ACCF/AHA/SCAI Guidelines for proposed PCI programs and, as such, is not consistent with the Statewide Health Care Facilities and Services Plan.

The Department of Public Health's *2012 Statewide Health Care Facilities and Services Plan* standards and guidelines for proposed primary and elective PCI programs draw from those set forth by ACCF/AHA/SCAI. The ACCF/AHA/SCAI Guidelines establish the appropriate minimum volume of PCIs that should be performed at both a facility and by the individual medical professionals administering the procedures. *FF13.*

A facility volume of fewer than 200 PCIs performed per year is, according to the 2014 update of the Guidelines, associated with worse patient outcomes. *FF29*. Therefore, it is recommended that a facility perform at least 200 PCIs per year, 36 of which should be primary PCIs. According to the Plan, "a facility with a volume of fewer than 200 procedures per year, unless located in a region that is underserved because of geography, should carefully consider whether it should continue to offer this service." Geographic isolation exists if the emergency transport time from a non-PCI facility to a PCI capable facility is greater than 30 minutes. *FF29.*

In 2015, patients originating from Backus' service area received approximately 369 PCIs at existing PCI-capable hospitals. *FF32.* Based on a presumed 100% retention rate of patients who went to Hartford and 36% of those who went to the other six hospitals not affiliated with Backus, the Applicants projected Backus would initially perform 165 PCIs—55 of which were primary. *FF32,33,35*. This projection falls significantly short of the 200 procedures recommended by the Guidelines.

L+M, which provides both primary and elective PCIs, is a 21-minute drive from Backus. *FF30.* It can be expected that the emergency transport time would be potentially shorter. As such, Backus does not qualify as geographically isolated and, according to the Guidelines, should not establish a PCI facility due to the likelihood it would fall below the minimum volume recommended for even a low-volume operator.

The Guidelines also state that "[m]ultiple low-volume and partial service-PCI centers within a geographic area diffuse PCI expertise, increase costs for the overall health system and have not been shown to improve access." *FF29.* Not only would Backus' PCI program be unlikely to meet the recommended minimum volume, it would likely have a negative impact on L+M patient volumes, creating precisely the multiple low-volume provider situation the Guidelines warn against. In 2015, L+M performed 216 angioplasty procedures. Sixty-three PCI patients originated from Backus' service area. *FF33.* Had those 63 patients gone to Backus, L+M would have performed only 153 PCI procedures, also falling below the recommended guidelines. *FF35.* L+M has stated that it has no backlog and can accept additional volume. *FF34.*

The Applicants have not satisfactorily demonstrated that the proposal will not result in an unnecessary duplication of services or how the proposal is needed based on utilization at existing PCI providers.

As discussed above, maintaining a certain level of utilization at existing providers is considered necessary to upholding the competency of a hospital and its physicians in performing PCIs. According to the Applicants, residents from Backus' service area who receive PCI treatment currently do so at Hartford, Yale-New Haven Hospital, L+M, Saint Francis Hospital, John Dempsey Hospital, The Hospital of Central Connecticut or UMass Memorial. *FF32.*

The proposal will impact existing providers and the existing providers are not currently being fully utilized by the Applicants. L+M would likely be the existing PCI provider most impacted by the Applicants' proposal. L+M performed 216 PCIs in 2015, 63 of which originated from Backus' service area. *FF32,33.* The Applicants and L+M presented multiple estimates as to the number of patients from Backus' service area who would seek service at Backus rather than the existing hospitals. The proposed retention rate estimates varied from 36% to 80%. *FF36.* Regardless of the precise retention rate applied, either L+M or Backus would not reach the minimum 200 procedures recommended by the Guidelines if the proposal is approved.

Additionally, L+M established its elective PCI program subsequent to entering into an Agreed Settlement with OHCA in 2013. *FF37.* The agreement was based on the expectation that L+M would be able to perform the Guidelines-established minimum number of PCIs of 200 per year. L+M does not anticipate that it will be able to meet the Guidelines minimum and will not be able to comply with this term of the agreement if Backus establishes a program. *FF37.*

The Applicants state that Backus is currently unable to meet the 120 minute door-to-balloon guideline regarding transferring AMI patients to a primary PCI-capable hospital. *FF19.* From 2011 through 2015, Backus' median door-to-balloon time was 134 minutes and travel time to a PCI-capable hospital accounted for the largest portion of Backus' transfer times. *FF19.* However, according to the Applicants, Backus has only transferred three patients to L+M, which is 21 minutes away. According to the Applicants, due to referral patterns, Backus transfers the majority of patients in need of primary PCI to Hartford, 40 minutes away. *FF20,32.* As such, the Applicants have not provided sufficient evidence demonstrating a need for a PCI program. The majority of patients that would be treated at Backus are currently being treated by other providers and, therefore, this proposal represents merely a shift in patient volume due to siphoning patients from existing providers.

The Applicants would likely be able to absorb the financial losses of the program.

The Applicants estimate Backus would need to perform 385 PCI procedures for the program to break even financially, and do not anticipate performing the necessary number of procedures through 2020, at which point they project the program would perform approximately 233 procedures *FF39.* The Applicants also estimate the proposal would necessitate nearly $5 million of capital expenditures in the form of an additional catheterization lab, new software and

equipment upgrades, as well as 3% of net patient revenues for ongoing capital needs. *FF40.* The program would operate at a loss of $355,363 in FY16, increasing to $705,757 in FY19. *FF38.*

The Applicants' projections, however, were conservative and assumed no increase in payer reimbursement but included increased costs and accounted for inflation. *FF38.* Additionally, the Applicants project income gains from overall operations at Backus from FY17 through FY19, sufficient to compensate for the program's increasing year-to-year losses. *FF42.* Although the program in itself would not be financially feasible due to increasing losses, the Applicants would be able to absorb those losses. As such, the proposal is financially feasible.

The Applicants have not satisfactorily demonstrated how the proposal would improve quality, accessibility and cost effectiveness of health care delivery, including to indigent and Medicaid patients.

The presence of a PCI program on-site at Backus would obviate the need for revascularization following a cardiac catheterization diagnosis, allowing the diagnostic and elective procedure to be completed together. This would reduce patient exposure to radiation and intravenous contrast used during the procedure. *FF12.* Currently, when Backus performs a cardiac catheterization and discovers a partial blockage, a patient must schedule an elective PCI elsewhere and then have the catheterization re-performed at that time. With the proposal, Backus would be able to perform the elective PCI at the time of catheterization.

As discussed, there are indisputable benefits to minimizing the time between when a patient presents at the emergency department and when the colluded artery is reopened. *FF18.* AMI patients currently presenting at Backus must be transported to a PCI-capable hospital, delaying treatment. Although a primary PCI program at Backus would decrease transport time, the Guidelines state that the door-to-balloon time should be within 120 minutes. *FF11.* Currently PCI-capable hospitals exist in Backus' area to which Backus could transport patients and the 120 minute window could be met. *FF32.* Although the Applicants have demonstrated how the proposal would improve quality of care, it is unclear the extent of the improvement.

Despite these potential benefits of the proposal, the Guidelines state that the minimum number of PCIs a facility should perform is set to maintain the competency of the hospital and its physicians. *FF29.* Should Backus' proposed program not meet that minimum, it is possible competency may not be maintained. Furthermore, the proposed program risks syphoning enough patients from existing hospitals to also depress the number of procedures performed at other area hospitals. *FF32,33,35.* It is possible quality may be compromised not only at Backus, but surrounding PCI-providers, as well.

The proposal would, as the establishment of a new service, likely increase access to care for Medicaid and indigent patients as Applicants' projected payer mix is comprised of 11% Medicaid and 37% uninsured. *FF43.*

Based on the aforementioned findings of fact, the Applicants have failed to meet their burden of proof in satisfying the statutory requirements of Conn. Gen. Stat. §§ 19a-639. The Applicants have neither satisfactorily identified the patient population to be served with an elective and primary PCI program nor have they demonstrated, in light of decreasing utilization and the existence of other providers in the area, that there is a clear public need for the proposed service. Furthermore, the proposal is likely to have a detrimental effect on existing providers in the area and may negatively impact the quality of care afforded patients. Finally, the Applicants have not sufficiently shown that the proposal is consistent with the PCI standards in the ACCF/AHA/SCAI Guideline and Statewide Health Care Facilities and Services Plan. However, as the proposal is neither a termination nor consolidation of health care providers, the proposal would not negatively impact the diversity of providers or choice for patients in the area.

Order

Based upon the foregoing Findings and Discussion, the Certificate of Need application of The William W. Backus and Hartford Hospital to establish a primary and elective PCI program without on-site surgical backup is hereby **DENIED**.

All of the foregoing constitutes the final order of the Office of Health Care Access in this matter.

By Order of the
Department of Public Health
Office of Health Care Access
