I. BACKGROUND

On October 25, 2016, a Partial Consent Decree¹ was approved between the United States, California, and the defendants to address installation and use of emissions control defeat device software (defeat devices). The defendants were the Volkswagen (VW) Corporation and its subsidiaries. The software was installed in approximately 500,000 model year 2009 through 2015 VW and Audi branded diesel vehicles, of which an estimated 11,911 vehicles were sold/leased in Connecticut. The use of the defeat devices has resulted in increased emissions of nitrogen oxide (NOx) in Connecticut and throughout the United States. NOx significantly contributes to the formation of ground level ozone which negatively impacts the respiratory system and cardiovascular health. One of the goals of the Partial Consent Decree is to offset the excess NOx emissions.

The Partial Consent Decree, among other actions contained within, establishes an Environmental Mitigation Trust (Trust) which will provide funds to all fifty states, the District of Columbia, Puerto Rico and federally recognized tribes, to implement actions to counter the air quality impacts of the excess NOx emissions resulting from the use of the defeat devices. The initial allocation to the State of Connecticut (State) under the Trust is approximately \$51.6 million dollars. The Partial Consent Decree establishes a process for states and tribes to receive the funds and requires the development of this mitigation plan, which summarizes how the State intends to use its allotted funds. The Partial Consent Decree also requires that this document be made available for public review and comment. This mitigation plan will also set out the process by which the Connecticut Department of Energy and Environmental Protection (DEEP) will administer the funds in the State and describe the types of mitigation actions or projects eligible for funding under the Trust along with a general description of the expected ranges of emission benefits.

II. CONNECTICUT'S AIR QUALITY CHALLENGES

On April 11, 2016, the Environmental Protection agency (EPA) made a final determination that Connecticut failed to attain the 2008 8-hour ozone National Ambient Air Quality Standard (NAAQS). Based on 2012-14 ambient air monitoring data², Connecticut was reclassified from marginal to moderate nonattainment and must achieve significant reductions in NOx emissions in order to attain the ozone NAAQS. The chart below shows the distribution of NOx emissions across the State's economic sectors, with the transportation sector being the major contributor.

Transportation emissions significantly impact the State's air quality and attainment

¹Partial Consent Decree: http://www.ct.gov/deep/lib/deep/air/mobile/vw/2016-10-25_-_VW_Partial_Consent_Decree-web.pdf

² EPA Final Rule: Determinations of Attainment by the Attainment Date, Extensions of the Attainment Date, And Reclassification of Several Areas for the 2008 Ozone National Ambient Air Quality Standards, April 11, 2016 <https://www.epa.gov/sites/production/files/2016-04/documents/20160411fr.pdf>

designation, being the source of 67% of the State’s NOx emissions, an ozone precursor; and 41% of its greenhouse gas (GHG) emissions (see Figures 1 and 3).

Figure 1: Sources of NOx in Connecticut (2014 NEI)

A. NOx and OZONE

NOx reacts in the atmosphere, in the presence of sunlight, to form ground-level ozone (smog). The adverse health effects of ozone and diesel exhaust are well documented^{3,4}. These studies show that ozone can irritate the respiratory system and affect lung function, even in otherwise healthy individuals. Exposure to high levels of ozone can enhance people’s sensitivity to asthma-triggering allergens such as pollen and dust mites, and can also increase the frequency and severity of asthma attacks.⁵

Ozone levels in the State are also significantly affected by the transport of ozone, as well as NOx and other precursors, from upwind states. Predominant weather patterns combined with Connecticut’s location relative to upwind emissions sources makes the state particularly vulnerable to levels of pollution transport that at times exceed the 8-hour ozone NAAQS. Additionally, the State continues to experience increases in vehicular activity, being a thruway

⁴ Diesel Exhaust and Health: Remarkable Progress, Lingering Concerns (2012): https://www.epa.gov/sites/production/files/2014-09/documents/2012_09_okeefe.pdf

⁵ Health Effects of Ozone in the General Population: <https://www.epa.gov/ozone-pollution-and-your-patients-health/health-effects-ozone-general-population>

between New York and Boston. Vehicle miles traveled in the State has increased by more than 2.1% over the last two years.⁶

Mobile source emissions, along with pollution from these upwind sources, generates air pollution that negatively impacts air quality and public health in the State.

B. CLIMATE CHANGE

There are many observed changes to the climate, such as rising temperatures and shifting snow and rainfall patterns, linked to increasing levels of GHGs in our atmosphere.⁷ In 2008, Connecticut passed the Global Warming Solutions Act, which established GHG targets of at least ten percent below the level emitted in 1990 by 2020 and at least eighty percent below the level emitted in 2001 by 2050.⁸ To that end, Connecticut continues to address climate change in a meaningful way by identifying new strategies and developing and supporting forward thinking policies and legislation.

GHG emissions from transportation, primarily carbon dioxide, have increased nationwide by about 17% since 1990⁹, and will continue to rise unless there is substantial reduction in the use of fossil fuels. Approximately 41% of Connecticut's GHG emissions are emitted by mobile sources (see Figure 2).

Transportation-related pollution is a function of vehicle emissions, the carbon content of transportation fuel, and vehicle miles traveled. Transportation fuel and emissions are the most likely of these three elements to be impacted by mitigation strategies. As such, promoting the use of zero or low emitting vehicles, providing a platform to facilitate the adoption of clean fuels and cleaner vehicles, and improving transportation system efficiencies will be a significant part of any efforts to mitigate both GHG and NOx emissions.

Figure 2: Distribution of Connecticut's Greenhouse Gas Emissions (EPA-SIT)

III. MITIGATION PLAN: OVERVIEW and GOAL

In accordance with the Partial Consent Decree, all potential Beneficiaries¹⁰ must create a mitigation plan summarizing how the allocated funds will be used. Specifically, the plan must describe:

- The State's overall goal for use of the funds,
- The categories of eligible mitigation projects anticipated to be appropriate to achieve the stated goals and the assessment of the allocation of funds anticipated to be used for each type of eligible mitigation project,
- What consideration will be given to the potential beneficial impact of selected eligible mitigation projects on air quality in areas that bear a disproportionate share of the State's air pollution burden,
- The anticipated ranges of emission benefits that would be realized by implementation of the eligible mitigation projects identified, and
- The State's process for seeking and considering public input on the Plan.

¹⁰ All governmental entities initially allocated funds under the Environmental Mitigation Trust must apply to become a Beneficiary of the Trust. See Appendix D, Section 4.0 of the [Partial Consent Decree](#)

In keeping with the above criteria, DEEP has developed this proposed plan to provide the public insight into its vision and overall approach to utilizing the mitigation funds allocated under the Trust. The primary goal of the State's Plan is to improve and protect ambient air quality by reviewing, analyzing and implementing eligible mitigation projects that will:

- Improve air quality by achieving significant and sustained cost effective reductions in NOx emissions,
- Expedite deployment and widespread adoption of zero emission and near-zero emission vehicles and engines, and
- Support statewide energy, environmental and economic development goals while also taking into account environmental justice considerations associated with each proposed eligible mitigation project.

The State has the discretion to adjust its objectives and specific spending strategy when necessary to achieve the Plan's goals and the State will update the Plan as necessary. Any updates to the Plan will be submitted to the Trustee and be made available on DEEP's public webpage addressing all VW settlement related issues, www.ct.gov/deep/vw.

IV. AVAILABLE FUNDING AND ELIGIBLE APPLICANTS

Upon becoming a Beneficiary, Connecticut will be eligible to receive \$51,635,238 (1.91% of the \$2.7 billion made available to states and Tribes) from the Trust as specified in Appendix D to the Partial Consent Decree. DEEP anticipates that Trust funds will be made available for mitigation projects by the fall of 2017, and at that time eligible mitigation project proposals will be solicited on forms provided by DEEP. The 2017 timeframe is subject to change because the Partial Consent Decree requires certain federal actions prior to beneficiaries being able to access funds from the Trust.

Both non-government and government entities are eligible to apply for funding to implement eligible mitigation projects. The State may request up to one-third of its total allocation during the first year or up to two thirds of its allocation during the first two years after the Trust is initially funded. Project funding will be awarded through an open and transparent process that will comply with all applicable state and federal procurement requirements.

DEEP will maintain and make publically available all documentation submitted in support of each funding request and all records supporting all expenditures of eligible mitigation project funds.

V. CATEGORIES OF ELIGIBLE MITIGATION PROJECT TYPES

The State will ensure that projects ultimately funded support the Plan’s goal. This goal will be achieved by establishing priorities and associated objective criteria to be used to guide the planning, solicitation, and project selection processes. The categories of eligible mitigation projects deemed appropriate to achieve the stated goal in this Plan are based on mobile NO_x emissions sources in the State (see Figure 3).

Figure 3: Breakdown of Mobile NO_x Emissions in Connecticut (2014 NEI)

A. FUNDING PRIORITIES

The funding priorities in this Plan are based on:

- The assessment of current NO_x emissions from mobile sources (see Figures 3 and 4),
- Demographic and locational data (see Figure 5),
- Anticipated NO_x emissions reductions or offsets from mobile sources, current and anticipated ground level ozone nonattainment areas,
- Existing air quality improvement measures and programs in Connecticut,
- Equity considerations for the distribution of the funds across the State,
- Capacity issues for certain sectors to implement programs in a timely and efficient

manner,

- Consistency with statewide energy, environmental and economic development goals, and
- Environmental justice considerations and other relevant factors.

These funding priorities, include, but are not limited to:

- Projects scaled to achieve the greatest NOx emission reduction or offset per dollar invested (i.e., capital cost effectiveness in dollars/ton),
- Transformative projects that promote other statewide energy, environmental and economic development goals while also taking into account environmental justice considerations,
- Government and non-government entities with demonstrated experience and existing administrative and programmatic structure in place for implementing diesel reduction or offset projects,
- Projects in areas that receive a disproportionate quantity of air pollution from diesel fleets such as but not limited to ports, rail yards, truck stops, airports, terminals, and bus depots,
- Projects with verified funding (i.e., for projects that require a cost-share) or leveraged funding,
- Projects that can be implemented within eighteen months of the award date, and
- Projects located in nonattainment areas, or areas with historical issues concerning compliance with federal air quality standards.

It is important to note that the above list consists of preferential funding criteria and should not be considered as eligibility criteria. Funding priorities are subject to change based on public input, new or supplemental air quality or other data, and other applicable factors.

Mobile NOx for CT - Diesel Only (2014)

Figure 4: Diesel Mobile NOx Emissions in Connecticut (2014 NEI)

CT Highway NOx Emissions by County (2014)

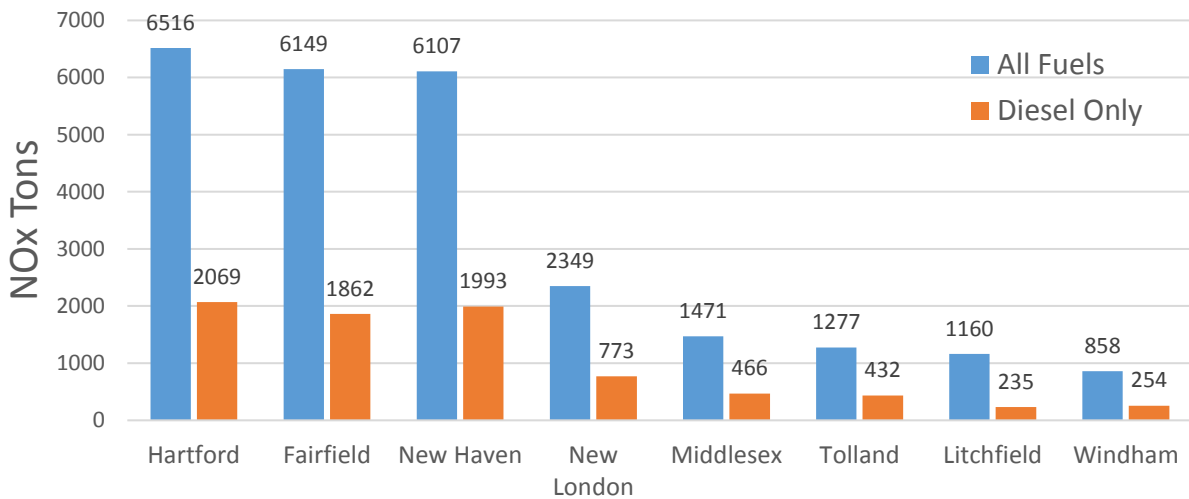

Figure 5: Connecticut Highway NOx Emissions by County (2014 NEI)

B. FUNDING ALLOCATIONS

Considerations informing the State's funding allocation approach for eligible mitigation projects, include but are not limited to: sources of mobile NOx emissions, sources of projected NOx emissions reductions, options to maximize funding allowed for the deployment of zero emission vehicle supply equipment and possible projects not specifically enumerated in Appendix D-2 of the Partial Consent Decree but eligible under the Diesel Emission Reduction Act (DERA).

This Plan proposes to fully support the deployment of electric vehicle supply equipment. Appendix D-2 of the Partial Consent Decree authorizes the use of up to 15% of the allocated Trust funds on the costs necessary for, and directly connected to, the acquisition, installation, operation and maintenance of new light duty zero emission vehicle supply equipment. However, under Appendix D-2, Trust Funds shall not be made available or used to purchase or rent real estate, other capital costs (e.g., construction of buildings, parking facilities, etc.) or general maintenance (i.e., maintenance other than of the supply equipment). The rest of the allocated funds will be used for the remaining categories of eligible projects outlined in the Partial Consent Decree that are aligned with the funding priorities presented in this Plan. Expenditures from the Trust can only be used for eligible non-government and government mitigation projects that are specified in Appendix D-2 of the Partial Consent Decree. The specific Trust expenditures under this Plan, excluding cost limits for non-government projects, will be subject to public input, solicitation criteria, and will also depend on actual projects received for funding consideration, and other factors.

The following information provides detail on the categories of eligible project types and anticipated benefits.

i. [On-Road Heavy Duty Vehicles](#)

On-road heavy duty vehicles emitted 7,501 tons or 19% of all mobile source NOx emissions in the State during 2014.

Eligible Mitigation Project Types: Class 8 Local Freight Trucks and Port Drayage Trucks (Large Trucks), Class 4-8 School Bus, Shuttle Bus, or Transit Bus (Buses), and Class 4-7 Local Freight Trucks (Medium Trucks).

Eligible trucks include 1992 - 2009 engine model years; and eligible buses include 2009 engine model year or older. Eligible trucks and buses may be repowered with any new diesel or alternate fueled engine or all-electric engine, or may be replaced with any new diesel or alternate fueled or all-electric vehicle, with the engine model year in which the mitigation action occurs or one engine model year prior.

Expenditures for Non-Government Owned Eligible Large and Medium Trucks, and Eligible Buses:

- Up to 40% of the cost of a repower with a new diesel or alternate fueled¹¹ engine, including the costs of installation of the engine,
- Up to 25% of the cost of a new diesel or alternate fueled vehicle,
 - The only exception to this limit is for eligible drayage trucks, which are eligible for

¹¹ As defined in Appendix B of this document.

up to 50% of the cost of a new diesel or alternate fueled vehicle

- Up to 75% of the cost of a repower with a new all-electric engine, including the costs of installation of such engine, and charging infrastructure associated with the new all-electric engine; and
- Up to 75% of the cost of a new all-electric vehicle, including charging infrastructure associated with the new all-electric vehicle.

Expenditures for Government Owned Eligible Large and Medium Trucks, and Eligible Buses:

- Up to 100% of the cost of a repower with a new diesel or alternate fueled engine, including the costs of installation of such engine,
- Up to 100% of the cost of a new diesel or alternate fueled vehicle,
- Up to 100% of the cost of a repower with a new all-electric engine, including the costs of installation of such engine, and charging infrastructure associated with the new all-electric engine; and
- Up to 100% of the cost of a new all-electric vehicle, including charging infrastructure associated with the new all-electric vehicle.

Expected Benefits include, but are not limited to:

- Tons of pollution reduced over the lifetime of the engines/vehicles, specifically NOx, and GHGs,
- Net reduction in gallons of diesel fuel and/or other fossil fuels used,
- Improved ambient air quality and human health in communities located in nonattainment areas, areas with historical air quality issues, or in areas that bear a disproportionate share of the air pollution burden, as well as benefits to the local economy; and
- Reduced public exposure to diesel particulate matter, which EPA has classified as a likely human carcinogen.

ii. Non-Road Equipment

Non-road equipment emitted 10,671 tons or 27% of all mobile source NOx emission in the State during 2014.

Eligible Project Types: Airport Ground Support Equipment, Forklifts and Port Cargo Handling Equipment.

Eligible airport ground support equipment includes Tier 0, Tier 1, or Tier 2 diesel powered airport ground support equipment; and uncertified, or certified to 3 grams per brake

horsepower-hour or higher emissions, spark ignition engine powered airport ground support equipment. Eligible forklifts include reach stackers, side loaders, and top loaders with greater than 8000 pounds lift capacity. Eligible port cargo handling equipment includes rubber-tired gantry cranes, straddle carriers, shuttle carriers, and terminal tractors, including yard hostlers and yard tractors that operate within ports.

Eligible Airport Ground Support Equipment, Forklifts or Port Cargo Handling Equipment may be repowered with an All-Electric engine, or may be replaced with a similar unit in an All-Electric form.

Expenditures for Non-Government Owned Eligible Airport Ground Support Equipment, Forklifts and Port Cargo Handling Equipment:

- Up to 75% of the cost of a repower with a new all-electric engine, including the costs of installation of the engine, and charging infrastructure associated with the new all-electric engine, and
- Up to 75% of the cost of new all-electric equipment, including charging infrastructure associated with the new all-electric airport ground support equipment, forklifts or port cargo handling equipment.

Expenditures for Government Owned Eligible Airport Ground Support Equipment, Forklifts and Port Cargo Handling Equipment:

- Up to 100% of the cost of a repower with a new all-electric engine, including the costs of installation of such engine, and charging infrastructure associated with the new all-electric engine, and
- Up to 100% of the cost of new all-electric equipment, including charging infrastructure associated with the new all-electric airport ground support equipment, forklifts or port cargo handling equipment.

Expected Benefits include, but are not limited to:

- Tons of pollution reduced or avoided over the lifetime of the engines/vehicles, specifically NOx, and GHGs,
- Net reduction in gallons of diesel fuel and/or other fossil fuels used,
- Improved ambient air quality and human health in communities located in nonattainment areas, areas with historical air quality issues, or in areas that bear a disproportionate share of the air pollution burden, as well as benefits to the local economy, and
- Reduced public exposure to diesel particulate matter, which EPA has classified as a likely human carcinogen.

iii. Commercial Marine Vessels

Commercial marine vessels emitted 1664 tons or 4.2% of all mobile source NOx emissions in the State during 2014.

Eligible Project Types: Ferries, Tugs, and Shorepower for ocean-going vessels.

Eligible ferries or tugs include unregulated, Tier 1, or Tier 2 marine engines. Eligible ferries and/or tugs may be repowered with any new Tier 3 or Tier 4 diesel or alternate fueled engines, or with all-electric engines, or may be upgraded with an EPA Certified Remanufacture System or an EPA Verified Engine Upgrade.

Eligible marine shorepower includes systems that enable a compatible vessel's main and auxiliary engines to remain off while the vessel is at berth, and include cables, cable management systems, shore power coupler systems, distribution control systems, and power distribution.

Expenditures for Non-Government Owned Eligible Ferries, Tugs and Shorepower for Ocean-going Vessels:

- Up to 40% of the cost of a repower with new diesel or alternate fueled (e.g., CNG, propane, hybrid) engines, including the costs of installation of the engines for ferries or tugs,
- Up to 75% of the cost of a repower with new all-electric engines, including the costs of installation the engines and associated charging infrastructure, and
- Up to 25% for the costs associated with the shore-side system, including cables, cable management systems, shore power coupler systems, distribution control systems, installation, and power distribution components.

Expenditures for Government Owned Eligible Ferries, Tugs and Shorepower for Ocean-going Vessels:

- Up to 100% of the cost of a repower with new diesel or alternate fueled (e.g., CNG, propane, hybrid) engines, including the costs of installation,
- Up to 100% of the cost of a repower with new all-electric engines, including the costs of installation of the engines and associated charging infrastructure, and
- Up to 100% for the costs associated with the shore-side system, including cables, cable management systems, shore power coupler systems, distribution control systems, installation, and power distribution components.

Expected Benefits include, but are not limited to:

- Tons of pollution reduced or avoided over the lifetime of the engines/vehicles, specifically

NOx, and GHGs,

- Net reduction in gallons of diesel fuel and/or other fossil fuels used,
- Improved ambient air quality and human health in communities located in nonattainment areas, in areas with historical air quality issues, or in areas that bear a disproportionate share of the air pollution burden, as well as benefits to the local economy, and the welfare of residents in such communities, and
- Reduced public exposure to diesel particulate matter, which EPA has classified as a likely human carcinogen.

iv. Locomotives

Locomotives emitted 639 tons or 1.6% of all mobile source NOx emission in the State during 2014.

Eligible Project Types: Freight Switchers

Eligible freight switchers include pre-Tier 4 switcher locomotives that operate 1000 or more hours per year.

Eligible Freight Switchers may be repowered with any new diesel or alternate fueled or all-electric engines (including generator sets), or may be replaced with any new diesel or alternate fueled or all-electric (including generator sets) freight switchers that are certified to meet the applicable EPA emissions standards as published in the code of federal regulations for the engine model year in which the eligible freight switcher mitigation action occurs.

Expenditures for Non-Government Owned Freight Switchers:

- Up to 40% of the cost of a repower with new diesel or alternate fueled (e.g., CNG, propane, hybrid) engines or generator sets, including the costs of installation,
- Up to 25% of the cost of a new diesel or alternate fueled (e.g., CNG, propane, Hybrid) freight switcher,
- Up to 75% of the cost for a repower with new all-electric engines, including the costs of installation of the engine and associated charging infrastructure, and
- Up to 75% of the cost for new all-electric freight switchers, including associated charging infrastructure.

Expenditures for Government Owned Freight Switchers:

- Up to 100% of the cost of a repower with new diesel or alternate fueled (e.g., CNG, propane, hybrid) engines or generator sets, including the costs of installation,

- Up to 100% of the cost of a new diesel or alternate fueled (e.g., CNG, propane, hybrid) freight switcher,
- Up to 100% of the cost of a repower with new all-electric engines, including the costs of installation of the engine and associated charging infrastructure, and
- Up to 100% of the cost of a new all-electric freight switchers, including associated charging infrastructure.

Expected Benefits include, but are not limited to:

- Tons of pollution reduced or avoided over the lifetime of the engines/vehicles, specifically NOx, and GHGs,
- Net reduction in gallons of diesel fuel and/or other fossil fuels used,
- Improved ambient air quality and human health in communities located in nonattainment areas, in areas with historical air quality issues, or in areas that bear a disproportionate share of the air pollution burden, as well as benefits to the local economy, and the welfare of residents in such communities, and
- Reduced public exposure to diesel particulate matter, which EPA has classified as a likely human carcinogen.

v. Light Duty Zero Emission Vehicle Supply Equipment

Light duty vehicles emitted 18,385 tons or 47% of all mobile source NOx emission in the State during 2014. Infrastructure investments would expedite the deployment of zero emission vehicles (ZEVs) and help offset emissions from the largest source of NOx emissions in State.

Eligible Project Types: Eligible light duty ZEV supply equipment includes:

- Light duty electric vehicle supply equipment: Level 1, Level 2 or fast charging equipment (or analogous successor technologies) that is located in a public place, workplace, or multi-unit dwelling and is not consumer light duty electric vehicle supply equipment (i.e., not located at a private residential dwelling that is not a multi-unit dwelling); and
- Light duty hydrogen fuel cell vehicle supply equipment: hydrogen dispensing equipment capable of dispensing hydrogen at a pressure of 70MPa (or analogous successor technologies) that is located in a public place.

Expenditures for Eligible Light Duty ZEV Supply Equipment:

- Up to 100% of the cost to purchase, install and maintain eligible light duty electric vehicle supply equipment that will be available to the public at a government owned property,

- Up to 80% of the cost to purchase, install and maintain eligible light duty electric vehicle supply equipment that will be available to the public at a non-government owned property,
- Up to 60% of the cost to purchase, install and maintain eligible light duty electric vehicle supply equipment that will be available at a multi-unit dwelling or a workplace but not to the general public,
- Up to 33% of the cost to purchase, install and maintain eligible hydrogen fuel cell vehicle supply equipment capable of dispensing at least 250 kilograms per day (kg/day) that will be available to the public, and
- Up to 25% of the cost to purchase install and maintain eligible hydrogen fuel cell vehicle supply equipment capable of dispensing at least 100 kg/day that will be available to the public.

Expected Benefits include, but are not limited to:

- Tons of pollution reduced over the lifetime of the zero emissions vehicle supply equipment, specifically NOx, and GHGs,
- Net reduction in diesel or gasoline used,
- Improved ambient air quality and human health in communities located in nonattainment areas, in areas with historical air quality issues, or in areas that bear a disproportionate share of the air pollution burden, as well as benefits to the local economy, and the welfare of residents in such communities, and
- Reduced public exposure to diesel particulate matter, which EPA has classified as a likely human carcinogen.

vi. Diesel Emission Reduction Act (DERA) Option

Approximating the tons or percentage of NOx emitted under this category is slightly more difficult because emissions will vary based on the actual source or project type. However, potential air quality benefits are weighted heavily in the selection of projects to be funded through the State's DERA program and such benefits are calculated for all of the projects implemented with State DERA funds.

The State DERA program has a wider range of eligible projects than those covered by the Trust. Potential diesel reduction mitigation projects not specifically enumerated in Appendix D-2 of the Trust but eligible for funding through DERA include but are not limited to:

- Replacement, repowering or engine upgrades of long haul locomotives,
- Replacement or repowering of agricultural or construction equipment,

- Replacement, repowering or engine upgrades of commercial vessels not limited to tugboats and ferries,
- Idle reduction technologies, including auxiliary power units and shorepower,
- Retrofit technologies for diesel vehicles or equipment, and
- Replacement or repowering of transport refrigeration units (TRUs).

This is not an exhaustive list of source types and projects eligible to apply for funding under the State’s DERA Clean Diesel Grant Program.¹² Any source type applying for grant funding will be subject to the requirements of the State DERA Program, including but not limited to general eligibility, project evaluation criteria, eligible project and administrative expenditures, cost-share, and funding restrictions. Additionally, DEEP’s criteria for evaluating and selecting projects for State DERA funding has consistently addressed location in environmental justice communities, which are characterized, in part, by disproportionate air pollution impacts, and nearness to diesel transportation hubs, including ports, rail yards and highways.

Expected Benefits include, but are not limited to:

- Tons of pollution reduced or avoided over the lifetime of the engines/vehicles, specifically NO_x, and GHGs,
- Net reductions, or avoidance, in diesel fuel use,
- Improved ambient air quality and human health in communities located in nonattainment areas, in areas with historical air quality issues, or in areas that bear a disproportionate share of the air pollution burden, as well as benefits to the local economy, and the welfare of residents in such communities, and
- Reduced public exposure to diesel particulate matter, which EPA has classified as a likely human carcinogen, and

This Plan is not a solicitation for projects. As such, the Plan does not include detail on the competitive application or project selection process.

VI. ANTICIPATED BENEFITS

There are many benefits to be realized from the implementation of the mitigation projects outlined in this Plan. Some of those benefits are outlined below.

A. ENVIRONMENTAL BENEFITS

The retrofit, repower, or replacement of eligible vehicles and equipment provides a wide

¹²Information on past grants and recipients: http://www.ct.gov/deep/cwp/view.asp?a=2684&q=322100&deepNav_GID=1619

range of emission benefits based on many variables, including the type of vehicle or engine replaced, the initial age of the engine, and the engine's duty cycle and power rating. Based on current EPA exhaust emission standards for NOx¹³:

- Heavy duty highway vehicles may provide up to 96% reduction in NOx emissions per vehicle, based on replacing a model year 1992 engine with a model year 2007 engine,
- Non-road equipment replacements, depending on the type of equipment and engine power rating, may provide between 20% and 95% reduction in NOx emissions for each engine,
- Locomotives may provide up to 89% NOx reduction per engine, based on replacing the oldest (Tier 0) engine with the newest (Tier 4) engine,
- Replacement or repower of a ferry or tug engine may provide up to 80% NOx reduction for each vessel, and
- Shorepower projects may reduce all NOx exhaust emissions from many ocean-going vessels.

These anticipated ranges of emission benefits were used to inform the Plan's funding priorities, categories of eligible mitigation projects, and funding allocation considerations for each category of eligible mitigation projects. It is important to note that the range of emission benefits mentioned above are for individual engines and actual NOx emissions reductions will vary based on the type of projects received for funding consideration, and the eligible mitigation projects ultimately funded. However, in order to achieve the goal of the Plan, it is a priority to fund sizeable and/or transformative projects designed to achieve the greatest emission reduction for the dollar (i.e. capital cost effectiveness in dollars/ton).

B. ENERGY AND ECONOMIC BENEFITS

Eligible mitigation projects, including the retrofit, repower or replacement of eligible vehicles along with the installation and operation of light duty zero emission vehicle supply infrastructure, will provide a wide range of energy and economic benefits to the State. As a result, this Plan intends to require the examination of both the energy and economic impacts of any proposed expenditures as these actions will support other important state interests.

Connecticut continues to make progress in reducing emissions of criteria pollutants and greenhouse gases while simultaneously supporting a clean energy economy. Connecticut has deployed a regulatory and institutional framework to support continued progress in reducing emissions and decarbonizing key sectors of the economy including buildings, electric generation and transportation. In conjunction with the state's continued efforts to advance clean energy

¹³EPA exhaust emission standard data: <https://www.epa.gov/emission-standards-reference-guide>

deployment, the State has focused investments in light duty zero emission vehicles and associated infrastructure. In the future, these investments may support the potential to capture increased benefits to the grid as well as the local electric distribution system.

Eligible mitigation projects specified in Part V of this Plan will provide energy and economic benefits to the State that may include, but not be limited to, increased sales of both diesel vehicles, non-road equipment and other eligible equipment along with associated tax revenue generated from non-governmental purchases. Increased equipment efficiency will reduce operation and maintenance costs and allow the redirection of these cost savings into other areas of the state's economy.

The State intends to allocate the maximum allowed to light duty zero emission vehicle infrastructure to support the deployment of electrified transportation options and further enhance the State's efforts to reduce greenhouse gas emissions from the transportation sector. Cost savings associated with reduced spending on petroleum can then be redirected to other areas within the State's economy. Proposals for eligible mitigation projects under the light duty zero emission vehicle infrastructure Plan will also be evaluated to determine the extent to which they leverage additional resources to support transformative technological changes and further the energy and economic benefits of the State and whether they also provide a firm base of support for emerging fuel cell or other alternative fuel transportation technologies.

APPENDICES

APPENDIX A: ELIGIBLE MITIGATION PROJECT ADMINISTRATIVE EXPENDITURES

For any eligible mitigation project, Trust funds can be used for the actual administrative expenditures associated with implementing such eligible mitigation project, but not to exceed 15% of the total cost of such eligible mitigation project. The 15% allotment includes the aggregated amount of eligible administrative expenditures incurred by the Beneficiary and any third-party contractors. These eligible administrative expenditures include the following:

- Personnel, including costs of employee salaries and wages, but not consultants;
- Fringe Benefits, including costs of employee fringe benefits such as health insurance, Federal Insurance Contributions Act (FICA), retirement, life insurance, and payroll taxes;
- Travel, including costs of mitigation project-related travel by program staff, not including consultant travel;
- Supplies, including tangible property purchased in support of the mitigation project that will be expensed on the “Statement of Activities,” such as educational publications, office supplies, etc.;
- Contractual, including all contracted services and goods except for those charged under other categories such as supplies, construction, etc. This includes contracts for evaluation and consulting services and contracts with sub-recipient organizations;
- Construction, including costs associated with ordinary or normal rearrangement and alteration of facilities; and
- Other costs including insurance, professional services, occupancy and equipment leases, printing and publication, training, indirect costs, and accounting.

APPENDIX B: DEFINITIONS

“*Airport Ground Support Equipment*” means vehicles and equipment used at an airport to service aircraft between flights.

“*All-Electric*” means powered exclusively by electricity provided by a battery, fuel cell, or the grid.

“*Alternate Fueled*” means an engine, or a vehicle or piece of equipment which is powered by an engine, which uses a fuel different from or in addition to gasoline fuel or diesel fuel (e.g., compressed natural gas, propane, diesel-electric hybrid).

“*Certified Remanufacture System or Verified Engine Upgrade*” means engine upgrades certified or verified by EPA or California Air Resources Board (CARB) to achieve a reduction in emissions.

“*Class 4-7 Local Freight Trucks (Medium Trucks)*” means trucks, including commercial trucks, used to deliver cargo and freight (e.g., courier services, delivery trucks, box trucks moving freight, waste haulers, dump trucks, concrete mixers) with a gross vehicle weight rating (GVWR) between 14,001 and 33,000 pounds (lbs).

“*Class 4-8 School Bus, Shuttle Bus, or Transit Bus (Buses)*” means vehicles with a GVWR greater than 14,001 lbs used for transporting people.

“*Class 8 Local Freight and Port Drayage Trucks*” means trucks with a GVWR greater than 33,000 lbs used for port drayage and/or freight/cargo delivery, including waste haulers, dump trucks, and concrete mixers.

“*Drayage Trucks*” means trucks hauling cargo to and from ports and intermodal rail yards.

“*Forklift*” means non-road equipment used to lift and move materials short distances, and generally include tines to lift objects. Eligible types of forklifts include reach stackers, side loaders, and top loaders.

“*Freight Switcher*” means a locomotive that moves rail cars around a rail yard as compared to a line-haul engine that move freight long distances.

“*Generator Set*” means a switcher locomotive equipped with multiple engines that can turn off one or more engines to reduce emissions and save fuel depending on the load it is moving.

“*Government*” means a state or local government agency (including a school district, municipality, city, county, special district, transit district, joint powers authority, or port authority, owning fleets purchased with government funds), and a tribal government or native village.

“*Gross Vehicle Weight Rating (GVWR)*” means the maximum weight of the vehicle, as specified by the manufacturer. GVWR include the following total vehicle weight plus fluids, passengers, and cargo:

- Class 1: < 6000 lbs
- Class 2: 6001-10,000 lbs
- Class 3: 10,001-14,000 lbs
- Class 4: 14,001-16,000 lbs
- Class 5: 16,001-19,500 lbs
- Class 6: 19,501-26,000 lbs
- Class 7: 26,001-33,000 lbs
- Class 8: > 33,001 lbs

“*Hybrid*” means a vehicle that combines an internal combustion engine with a battery and electric motor.

“*Infrastructure*” means the equipment used to enable the use of electric powered vehicles (e.g., electric charging stations).

“*Intermodal Rail Yard*” means a rail facility in which cargo is transferred from drayage truck to train or vice-versa.

“*Port Cargo Handling Equipment*” means rubber-tired gantry cranes, straddle carriers, shuttle carriers, and terminal tractors, including yard hostlers and yard tractors that operate within ports.

“*Repower*” means to replace an existing engine with a newer, cleaner engine or power source that is certified by EPA and, if applicable, CARB, to meet a more stringent set of engine emission standards. Repower includes, but is not limited to, diesel engine replacement with an engine certified for use with diesel or a clean alternate fuel, diesel engine replacement with an electric power source (grid, battery), diesel engine replacement with a fuel cell, diesel engine replacement with an electric generator(s) genset, diesel engine upgrades in ferries or tugs with an EPA Certified Remanufacture System, and/or diesel engine upgrades in ferries or tugs with

an EPA Verified Engine Upgrade. All-Electric and fuel cell repowers do not require EPA or CARB certification.

“School Bus” means a Class 4-8 bus sold or introduced into interstate commerce for purposes that include carrying students to and from school or related events.

“Scrapped” means to render inoperable and available for recycle, and, at a minimum, to specifically cut a 3-inch hole in the engine block for all engines. If any eligible vehicle will be replaced as part of an eligible project, “scrapped” shall also include the disabling of the chassis by cutting the vehicle’s frame rails completely in half.

“Tier 0, 1, 2, 3, and 4” refers to corresponding EPA engine emission classifications for non-road, locomotive and marine engines.

“Tugs” means dedicated vessels that push or pull other vessels in ports, harbors, and inland waterways (e.g., tugboats and towboats).

“Zero Emission Vehicle (ZEV)” means a vehicle that produces no emissions from the onboard source of power (e.g., all-electric or hydrogen fuel cell vehicles).

APPENDIX C: PUBLIC COMMENT PERIOD ACTIVITIES

DEEP will solicit and compile public comments on the proposed mitigation plan. Responses to comments will be posted on DEEP's VW webpage at www.ct.gov/deep/vw. Changes resulting from submitted comments will be incorporated into the final Plan.
