

Fig. 3. Sketch map of the Essex and Old Lyme quadrangles, showing principal valley trains, labeled as in the text. Valley trains have been restored to indicate their inferred approximate extent before they became dissected. Thick arrows indicate inferred local directions of flow of meltwater streams. Shaded areas indicate ice-contact stratified-drift facies; unshaded areas indicate outwash facies. Dotted lines represent shore of Long Island Sound. Place names are shown on plates 1 and 2.
