

Mr. Sullivan,

On page 27 of 50 in the Five Mile River Watershed Summary it states that previous sampling of discharge from the New Canaan DPW has shown elevated levels of fecal coliform bacteria//Table 8.

Please clarify

Looking at table 8 the WPCF is well within the 200/100ml Limit and Table 7 MS4 samples do show high E.coli colonies which most likely are attributed to geese/etc.

Many Thanks

Jim
