

Reported chronic hepatitis C, Connecticut, 2010

Number reported per town

Number of confirmed chronic or resolved cases: 1894.
 Number of cases geocoded: 1812.
 Range of cases geocoded per town: 0 - 184.
 Town of residence at first report.

Chronic hepatitis C: a case with a positive anti-HCV result with a signal to cut-off predictive of a true positive as determined for the particular assay or confirmed with a more specific test (e.g. RIBA, PCR, genotype). Some people included in the chronic data may have a positive antibody test but no longer carry the virus due to a resolved infection and/or treatment (approximately 15%).
