

Statewide estimate of the population unaware of their HIV infection and demographic distribution, Connecticut, 2012

Diagnosed 2008-2012*			PLWHA and		Distribution of	
			PLWHA	Unaware**	Unaware	
Total	1,764	100.0%	10,474	12,439	1,965	100.0%
Male	1,287	73.0%			1,434	73.0%
Female	477	27.0%			531	27.0%
White	519	29.4%			578	29.4%
Black	700	39.7%			780	39.7%
Hispanic	490	27.8%			546	27.8%
Multi-race		0.0%			-	0.0%
Asian		0.0%			-	0.0%

IDU	176	10.0%			196	10.0% 13.6%
MSM	709	40.2%			790	40.2% 54.8%
MSM/IDU	26	1.5%			29	1.5% 2.0%
Hetero	378	21.4%			421	21.4% 29.2%
Pedi	5	0.3%			6	0.3% 0.4%
Unk	470	26.6%			524	26.6%
0-12		0.0%			-	0.0%
13-19		0.0%			-	0.0%
20-29	442	25.1%			492	25.1%
30-39	427	24.2%			476	24.2%
40-49	481	27.3%			536	27.3%
50+	355	20.1%			396	20.1%

Cases with known risk
1,442

* Connecticut HIV Surveillance Program data from eHARS as of December 31, 2013

** 15.8%

*** Distribution of risk among those with known risk.

¹This estimate is based on the CDC estimate of the percentage of persons with HIV infection unaware of their HIV positive status (HIV Surveillance Supplemental Report 2013; 18(No.5). The limitations of this approach include: a) the national estimate may not be applicable to local jurisdictions; b) not all cases diagnosed in 2008-2012 have been reported as of December 31, 2013; c) among recently diagnosed cases the number reported without a presumed source of infection is higher than cases diagnosed several years ago due to the lag in reporting of this information; and, the PLW number includes some cases who have died but for whom the death has not been reported and cases that were previously diagnosed in other states but have not yet been de-duplicated.
