

Table 4. Number and percentage of persons with a high viral load^a (>100,000 copies/ml) among persons who were >= 13 years of age on 12/31/2012, residing in Connecticut (based on the most recent residence before death), diagnosed with HIV infection through 12/31/2012 and living with HIV infection through 12/31/2013, by selected characteristics - based on HIV surveillance data reported through 12/24/2014.

Characteristics	Overall population ^b		Persons with >=1 VL test from 01/01/2013 through 12/31/2013		VL ^c >100,000 No.	VL ^c >100,000 (Among the overall population)		VL ^c >100,000 (Among persons with >=1 VL test)	
	No.	% ^d	No.	%		%	%		
Sex									
Male	6508	65.9	4792	73.63	106	1.63	2.21		
Female	3367	34.1	2587	76.83	70	2.08	2.71		
Age on 12/31/2012									
13-24	317	3.21	229	72.24	5	1.58	2.18

Total	9875	100	7379	74.72	176	1.78	2.39		

^aThe validity of the Monitored Viral Load output that results from this analysis is dependent upon the completeness and quality of state/local HIV surveillance data.

^bThe overall population may be overestimated because only 11 months were allowed for follow-up of cases after 12/31/2013. CDC recommends that every case be allowed at least 18 months for follow-up in order to collect death certificate information.

^cBased on the most recent viral load test result from 01/01/2013 through 12/31/2013.

^dThe total percent represents the column percent.

^eAmerican Indian/Alaska Native, Asian, Native Hawaiian/Other Pacific Islander, Multiple races, and unknown race.

^fHeterosexual contact with a person known to have, or to be at high risk for, HIV infection.
