

Table 3. Number and percentage of persons with viral<sup>a</sup> suppression (<=200 copies/ml) among persons who were >= 13 years of age on 12/31/2012, residing in Connecticut (based on the most recent residence before death), diagnosed with HIV infection through 12/31/2012 and living with HIV infection through 12/31/2013, by selected characteristics - based on HIV surveillance data reported through 12/24/2014.

Characteristics	Overall population <sup>b</sup>		Persons with >=1 VL test from 01/01/2013 through 12/31/2013		VL <sup>c</sup> <=200	VL <sup>c</sup> <=200 (Among the overall population)	VL <sup>c</sup> <=200 (Among persons with >=1 VL test)
	No.	% <sup>d</sup>	No.	%	No. <sup>e</sup>	% <sup>e</sup>	% <sup>e</sup>
<b>Sex</b>

<sup>a</sup>The validity of the Monitored Viral Load output that results from this analysis is dependent upon the completeness and quality of state/local HIV surveillance data.

<sup>b</sup>The overall population may be overestimated because only 11 months were allowed for follow-up of cases after 12/31/2013. CDC recommends that every case be allowed at least 18 months for follow-up in order to collect death certificate information.

<sup>c</sup>Based on the most recent viral load test result from 01/01/2013 through 12/31/2013.

<sup>d</sup>The total percent represents the column percent.

<sup>e</sup>The number (and the percentage) might be higher than those from table VL1 of NHAS Indicator SAS Program since this program uses ½ of the Lower Limit of Detection (LLD) for persons who have a viral load below the limit of detection or undetectable results.

<sup>f</sup>American Indian/Alaska Native, Asian, Native Hawaiian/Other Pacific Islander, Multiple races, and unknown race.

<sup>g</sup>Heterosexual contact with a person known to have, or to be at high risk for, HIV infection.
