Dear Parent:

As the school nurse at [INSERT SCHOOL NAME], I am writing to inform you about the dangers of meningococcal disease, commonly known as meningitis, a potentially fatal bacterial infection that can strike teenagers and college students. The disease can come on quickly and may cause death or permanent disability within hours of the first symptoms; although rare the disease may be prevented through vaccination.

The U.S. Centers for Disease Control and Prevention (CDC) recommends meningococcal immunization for all adolescents 11-18 years of age.

Teenagers and college students have an increased rate of meningococcal infection compared to the general population, accounting for nearly 30 percent of all U.S. cases annually. Of those who survive, up to 20 percent suffer long-term disabilities, including brain damage, loss of hearing, organ failure and limb amputations.

Meningococcal disease can be misdiagnosed as something less serious, because early symptoms are similar to those of influenza or other common viral illnesses, including high fever, headache, nausea and stiff neck. That is why immunization is so important. A conjugate meningococcal vaccine is available that public health officials anticipate will provide longer protection against four of the five strains of bacteria that cause meningococcal disease. Although teenagers and college students are at increased risk for contracting the disease, up to 83 percent of cases in this population may be prevented through immunization.

As your child’s school nurse, I encourage you to speak to your child’s physician about meningococcal disease and to consider immunization. For more information about meningococcal disease and immunization, please feel free to contact the state Immunization Program at 860-509-7929 or visit the CDC Web site at www.cdc.gov/vaccines/.

Sincerely,

[INSERT NAME OF SCHOOL NURSE]
