

Target Populations for Breast Cancer Outreach and Education

Details Shown for Hartford, Connecticut

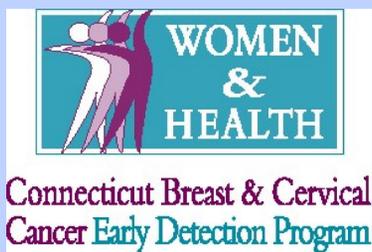

November 2011

Combining Factors Identifies Priority Neighborhoods

- Connecticut Breast and Cervical Cancer Early Detection Program Contracts
- Subcontracted Intake Centers

On July 6, 2010 the Centers for Disease Control and Prevention published "Vital Signs: Breast Cancer Screening Among Women Aged 50-74 Years - United States, 2008" which identified age-adjusted mammography prevalence in the United States. Of the populations with the lowest prevalences reported were women without health insurance, those with an annual household income less than \$15,000, women who did not finish high school, and women in the 50 - 59 age range. This map shows overlying characteristics that represent a combination of factors associated with lower prevalences of mammography as a means to identify target populations for outreach. Insurance coverage data from the 2008-2010 American Community Survey 3-Year Estimates is expected for release in December of 2011, at which time this analysis will be re-examined.
